Try this one :
ftp://chapelie.rma.ac.be/atari/archivers/zip20.lzh

It works perfectly and is faster than STZIP on CT60.

Cheers
St&#65533;phane

fVDI itself should certainly work, but the RageII driver currently does
not. I tried to get it up and running on a Milan some years ago but ran
into some kind of problem accessing the card. This was testing and
debugging via email, though, which isn't the most efficient way to go
about things. ;-)
(I don't have access to a Milan or Hades.)

It would have been very nice to have that feature on the Eclipse, but
the CPLD used for the PCI interface didn't have room for anything fancy.
So, the current RageII driver ends up doing a whole bunch of byte
swapping, unfortunately (not that it matters much when the Falcon bus
is usually the performance limiting factor, anyway).

I wonder if that might have been the problem I had with fVDI/RageII on
the Milan, which I mentioned above?
AFAICR, there's no support in the Atari PCI BIOS "standard" for reporting
separate address spaces for separate uses (the Eclipse has a similar
separation for 16 and 32 bit accesses if memory serves me right).

There seems to be pretty decent open source nVIDIA driver support out
there too. Perhaps not for Linux (haven't checked), but under BeOS they
even have rather good 3D performance, apparently.
QuakeII is supposed to be running, along with other OpenGL things.

See here, for example:
http://web.inter.nl.net/users/be-hold/BeOS/NVdriver/bench/bench_v041.html

>>> I still say that the Voodoo cards would be the best choice considering

Documentation is definitely much nicer than X sources. ;-)

>Those cards are ancient. Asking my voodoo 3 to do 1680x1050 which I need
>for my LCD would not go well. If we're going to do it, we should do it

Are you sure?
I'd be very surprised indeed if a Voodoo 3 had trouble with resolutions
like that. Even the (far more) ancient RageII used with the Eclipse can
do 1600x1200 (only at 60 Hz, but that's enough for an LCD, and not at
32 bit colour (too little memory and possibly bandwidth)).

Someone else commented that even a CT60 would have trouble throwing
around the data for a mode like that, but that's missing the point
completely, in my opinion. There are very few situations where you'd
actually want or need to do anything much with the CPU for all those
millions of pixels. Usually you'd let the hardware acceleration work
for you, and that is very very fast indeed.

>right. Even if ATI cards have less support, they have the support we need
>to get things up and running. They're VERY fast too. The eclipse makes a
>stock falcon twice as fast. Just ask Carey. 128kbit mp3 on a falcon uses

I suppose that number is related to the fact that you can set the Falcon
to monochrome mode and still get colour graphics (so that more of the
bus bandwidth is free for the CPU)?

>devs choose what they're most comfortable with, and I'd say ATI is it. We

As someone said, anyone is of course free to write a driver for some
other hardware. It really isn't very hard to do (assuming you have
decent documentation or equivalent).
I'd really like to do one for the Voodoo cards myself, but I'm not sure
I'll ever find the time for that.

Message-ID: <431f1480123d90@adelphia.net>
Source record: 11300

Galen,
I have done it with Aniplayer. Usually a 90 percent load with NO skips.
Get above 128 like 160 and it wont play without sounding like a record.
I have a stock Falcon that I gave to Mark D. to work on an accellerate for
me. We have the DSP running at 50 mhz. the Videl at 40 mhz and the CPU/Bus
running at 20 mhz. Then I had Mark put a 68882 FPU in and he overclocked it
to 50 mhz. I have since removed the OSC. and installed a 64 mhz and it runs
very nicely. When I recieved my Falcon back I immediately tried playing a
128 Kb/sec MP3 with 60 percent load according to Aniplayer. Mark did not tell
me what he got for numbers before shipping it off to me. Then I installed my
Eclipse and immediately noticed a HUGE drop agian. Playing 128 Kb/sec MP3's
went down to 30-40 percent with the average being in the upper 30's. Not bad
really considering this is only a backup Falcon. I plan on hooking my EtherNec
to this Falcon once I get my EtherNat for my CT60'ed Falcon. But doing all of
that acceleration on Mark's part was well worth the money and coupled with the
Eclipse it becomes a very usable computer with more than just demos now.

Thanks,
Carey

This is a shame that even the PCIBios can not inform driver about the bus
endianness. It means drivers have to be modified for each hardware
(milan/hades/eclipse/ctpci), right? I would not want to code a driver when
the hardware can be different. I know that endianness has changed in
latest pcibios revisions.

Michael, as you worked on various Milan drivers, could you tell us more
about the vga part? Is there a generic VGA driver in Milan Rom that can
be used on any card that support VGA modes (i.e up to 64K) ? Could it be
modified/adapted to run on eclipse, hades or planned ctpci hardware?

There's a command-line utility which can split a ZIP archive into several
valid little ZIP archives, it's called zipsplit (part of InfoZIP, IIRC). I
have no idea if this tool has been ported to the TOS platform.

Maybe voodoo5. I remember my voodoo 3 (even the 16MB version) having a
1280x1024 limit. The voodoo5 was a nice card. It'd be nice to see
drivers for that ;)

The more choice the merrier. I'd prefer ATI drivers for quite new cards
so that as hardware acceleration is done, it's quite fast. Considering
ATI stuff is a proven concept, I thought it made more sense, but the
bottom line is whatever, the people developing the (likely free) drivers
want to use they should get to use without any whining ;)

Thanks,
Mark

Hi Mike!

I don't know if you know, but there are later versions of both:
ZIP23_02 and UNZIP540. Usually I use ArcView which calls
UNZIP540.TTP, or sometimes 2-in-1 which calls ZIPJR.TTP. So far I
haven't come across any ZIPs which one of these didn't handle (but
I haven't tried to unzip any of those mentioned above).

Source record: 11396

I am not sure of your question, but ANY recent VGA monitor can handle Falcon resolutions (including Centscreen or Videl Insile ones).

The better the monitor is, the higher refresh rate you can get.

As for the VERY LOW resolutions, I think you'll need and old Nec Myltisync 3D (it was great!)

Hope this helps

Hi J-Luc!

I use this program on the Falcon and it works fine. Note that you
need both SPLITTER.TTP and SPLITTER.PRG in the directory (I think
the PRG is a GEM shell that calls the TTP to do the actual work).

But are you sure that the splitting process with WinZip is the
same? Is the same index/CRC file generated (or at least one that
Splitter understands)?

Regards, /Peter/

3922. EtherNat: time to place your order!

Newsgroup: comp.sys.atari.st
Date: 2005-09-07 21:21:10 UTC
From: hencox <hencox@hotmail.com>
Message-ID: <1126128069.986514.321310@o13g2000cwo.googlegroups.com>
Source record: 11398

Hi all CT60 users and atarians!

The registration period for the EtherNat ends today and now it's time to give you info on how to prepay us for your orders. Of course anyone can order an EtherNat now even if they missed the registration period. We hope you'll understand that we have to request pre-payment to make sure we won't go personally bankrupt because we've produced more boards than we can sell...

First of all you must fill in the form below and email it to us. In the form you choose how you want to pay for your order.

The easiest way (and a very safe way) to pay us is via PayPal. Simply sum up the total of your order including packaging and postage and add 4% to that (to cover the fees that PayPal requests from us when we withdraw your money). Then send that money (in EUROs) to "hencox at hotmail dot com". We'll check that your payment is according to your order and then confirm your order via email to you. Please give us a few days to confirm your order, since we will probably receive many orders the first few days.

If you want to pay using bank transfer (easy within Sweden) make a corresponding mark in the form below, and we'll email you the necessary details.

You see below the necessary information to calculate the total cost of your order:

Within Europe (EURO):
Price of 1 EtherNat: 125 (non-EU countries: 100)
Shipping for 1 - 2 boards: 16
Shipping for 3 - 4 boards: 20
Shipping for 5 - 8 boards: 26

Rest of the world (EURO):
Price of 1 EtherNat: 100
Shipping for 1 - 2 boards: 17
Shipping for 3 - 4 boards: 21
Shipping for 5 - 8 boards: 28

Within Sweden (SEK):
Price of 1 EtherNat: 1175
Shipping for 1 - 2 boards: 88
Shipping for 3 - 4 boards: 99
Shipping for 5 - 8 boards: 110

Fill in this form and email to us:

First name:

Last name:

Full address:

Number of EtherNat boards:

Payment method (put an X): Paypal | | Bank transfer | |

Total amount of money (Euros outside Sweden, otherwise SEK):

3923. Re: Display monitors for CT60

The CT60 does not itself add resolutions as far as I know. However, if you also modify the Falcon's bus to 25MHz, then the Videl can run a very nice 800x608x256 or 640x480x16bit resolution at over 60 Hz. Of course, somewhat higher resolutions and refresh rates are possible, but this will affect your computer's apparent speed due to the limited Falcon bus.

Your typical multisync (S)VGA monitor will do fine. This means practically any CRT made in the past 7 years.

Galen

I just did a quick search for Voodoo 3 3000 reviews and they were talking about
350 MHz RAMDACs and up to 2046x1536@75Hz resolution support.

...
>Right, and I expect us to use at least some of that hardware acceleration.

You can rest assured of that.

> I have an expectation for this mode to be possible - we'll see though if
> that can be reality.

I normally run my Eclipse/RageII at 1152x864x16bit@70+ Hz and that's
blazingly fast (when you don't need to transfer colour data via the Falcon
bus, that is). The monitor I use can't deal with more, but the card could.
With a modern graphics card, the CT60 and the PCI bus are likely the only
limitations on the 2D speed.

Anyway, the basics of 2D acceleration (mouse, blits and fills) should be
pretty simple on just about any kind of hardware.

There is nothing to it.

Plug the power cable in the back, the TV lead to the TV (or the monitor cable into the monitor if thats what you have), the mouse into the left socket underneath the keyboard, a joystick (if required) into the right socket and turn it on.

There isn't much in the manuals that you cant work out from looking at and experimenting with the machine.

Coda.

>the hardware can be different. I know that endianness has changed in
>latest pcibios revisions.

No. The PCI BIOS which we defined for Milan and Hades provides exactly this information - in the ressource descriprots, the PCI BIOS tells the driver which endianness the bridge uses for each memory/IO space. Using this information, it should be able to write drivers that are not machine-specific.

>Michael, as you worked on various Milan drivers, could you tell us more

>be used on any card that support VGA modes (i.e up to 64K) ? Could it be
>modified/adapted to run on eclipse, hades or planned ctpci hardware?

There are multiple layers that need support.

First is getting the card initialized during power-up, before memory test etc. is run, so that the user can see error messages etc.. On the Milan, the Bootblock (which does hardware init, memory test etc., before passing control to TOS) contains text-mode init code for S3 Trio cards, plus a small 8086-emulator that can execute ROM BIOSses of some cards - ATI Rage cards are known to work, some S3 also. Other cards may need modifications in the emulation code, because is is basically a 8086 emulator with some 80386 extensions, and some modern BIOSses contain 80386 commands - so new cards may require implementing some additional opcodes in the emulator.

Using either method, the VGA card is set to 640x480 monochrome graphics mode when TOS starts up - this is basically a SM124-like video mode with an additional 80 pixel lines, where the CPU does all the drawing.

Next, the Milan VGA driver is run from the auto folder. It stays rersident and provides callbacks which TOS uses during VDI init, so that the ROM VDI can be used to drive the graphics card, and the ROM VDI calls the low-level driver for stuff like video-mode setup, and for low-level graphics operations which are implemented in hardware (linedraw, blit etc.).

Here's a last-minute reminder of this weekend's event:

Subject: Atari swapmeet to be September 10 in Columbus, Ohio

Here are details for the annual swapmeet to be held by
the Columbus Atari club:

DATE: Saturday, September 10, 2005.
TIMES: 9 am to 3 pm.
ADMISSION: $4. (For vendors, including table: $6.)
PLACE: Oakland Park Community Building, 980 Lenore Avenue,
Columbus, Ohio.
MORE INFO AT: http://www.angelfire.com/oh4/acec/acec.html
CONTACT: R. Wayne Arenz (rarenz at columbus dot rr dot com)

...as a side note, there was apparently only a single disk included with the IB drive. It contained at auto folder with the res.prg program, and a disk formatter. I learned by trawling through the STart magazine archives on atari-archive.org that the res.prg MUST be the FIRST program in the AUTO folder, and also, that, apparently, it REQUIRES a disk in the IB drive. The last part seems to be false as I did a quick experiment, and it seemed to still work when booted without a disk in the drive. I also recall that I must have had problems with this driver (changes seek rate) in the past.

The other program that I had was called dseek.prg and it changes the seek rate for drive B to 6ms. I obtained this program from the umich ST archive, Disk(IIRC) folder contained in the ibmdrive.lzh archive. This archive also contained the previously referenced articles by Dave Small and others about adding IBM drives to an ST and the necessity to increase seek time for 5.25" disks.

All of this was tested on a 1M upgraded 520ST, TOS
1.0, no other upgrades or hacks. The drive is the IB40, or the 40 track version of their 5.25" drives, and was hooked up to a standard SF314 DSDD drive. I'd presume that there are other utilities out there that will do the same, but in my quick search this was the best that I could turn up, and it would seem that using the dseek.prg is the most reliable way to go at this time.

3934. PeST upadte

Hi all,

sorry ive been quiet of late, my ISP decided to change news server and never told me so I have been without news for the past 2 weeks :-(Sorry if anyone has not had a reply from me during this time.

PCB's will be arriving soon, please see more info at

http://www.cps-electronics.co.uk/web/PS2.htm

We still need more orders!

Alison has a couple of boxed versions up for grabs on ebay. If you want one then I suggest you grab one now as she will not be making many of those types.

If anyone wants to be a distributor for thier country then we offer bulk discounts where you get 5 FREE PeST and lower postal costs to save over
100! Discount on bulk orders only. Distributor can sell at what ever price he likes. Distributor will make some easy cash and customer for that country will be able to obtain PeST more local, ideal for people who can't send payment overseas!!!! everyones a winner! See the webpage for more info.

Chris

Amazingly enough, I never saw that documentation about the resource
descriptors until today!
As you say, they can indeed provide exactly this kind of information.

I suppose they probably weren't implemented in the Eclipse PCI BIOS, or I'm
sure I would have used them. If I had, the Eclipse/RageII driver may already
have been working on the Milan and Hades...
Not that it's too late to do something about that now, of course. I'll put it
on my to do list immediately.

I heard about that long ago, but never thought it could actually be true.
Sounds like an amazing amount of work for very little benefit (I understand
you don't use the card's BIOS anyway once the VDI is started?), or did you
have access to the emulator already?

Is such a thing as a "small 8086-emulator" even possible?

No, not really. Uwe started with emulator source code from some DEC Alpha
project (which had the same problems regarding VGA initialization), but
ended up writing something new.

>Is such a thing as a "small 8086-emulator" even possible?

The complete Milan bootblock fits in one 64k flash sector - including the
emulator. IIRC, the emulator uses something around 32K of code, and not very
much RAM (in excess to that which the emulation uses - but 64K should be
enough for VGA BIOS usage).

The BIOS is not used once the card is under VDI control, but the problem ist
exactly the first phase: getting the card initialized from reset to a state
where is it VGA compatiblem and even able to display a text screen - the
magic required to do this is rarely documented (even if you have full
documentation - it took quite some work to get this working on the S3 Trio),
plus it may depend on the special card and not only on the graphics chip
(due to different types and amounts of memory, different DAC/clockgenerator
etc.), so using an emulation to run the BIOS that comes with every card
certainly looks attractive.

Hi, fellow Atarians,

My Falcon is running Magic 6.2 and MagicNet. I have one of Elmar Hilgart's cartridge-port ethernet adaptors which, with Vassilis's RTL8012.MIF driver, works nicely with an ADSL router/modem in 68030 mode.

However, although I have had no other problems with the CT63 (touch wood), this combination does not work in 68060 mode. Some things seem to trying to happen, in that the activity light on the adaptor flashes, but I can't establish any communication. I can't even ping the router.

My '060 is the full version, so I hope that the note in CT60/63 ST-Guide file about the cartridge port does not apply.

As I have put my hand up for an EtherNAT, getting this working may be a waste of time but I'd stiil like to try.

Any bright ideas?

By the way, the above set-up works nicely with my ST, MSTe and TT.

Neat!

>The BIOS is not used once the card is under VDI control, but the problem ist
>exactly the first phase: getting the card initialized from reset to a state
>where is it VGA compatiblem and even able to display a text screen - the

Yes, I'm well aware that this can be a significant problem.

But surely the VDI side of things needs much the same anyway? Well, not
actual VGA compatibility, but at least a way to set modes you can draw in.
Obviously, such modes will not work the same on all cards, unlike VGA, but
you need to be able to use them later, anyway.
(Unless you want to be able to have the system work on unknown graphics
cards albeit without acceleration.)

For the Eclipse/RageII we "cheated" and simply disregarded the boot up
sequency completely. If you want to see what's happening at that point,
you need to connect a monitor to the standard Falcon video circuitry.
Not really a problem for most users, I think. At least I've not had
many complaints. ;-)
It would have been possible, though, to redirect the BIOS screen output
to specialized routines in fVDI so that text output during boot up had
indeed been working (after fVDI starts, that is).

>magic required to do this is rarely documented (even if you have full
>documentation - it took quite some work to get this working on the S3 Trio),
>plus it may depend on the special card and not only on the graphics chip
>(due to different types and amounts of memory, different DAC/clockgenerator

For the Eclipse/RageII we had the same problem (we never tried to get any VGA compatible modes working, but the hardware accelerated ones need similar configuration). Rather than writing an x86 emulator, we (or rather Sven in this case) simply "dumped" the card configurations from a PC and stored all the relevant values in the fVDI driver.

This is the main reason why the Eclipse/RageII driver only supports two specific RageII cards (it checks the PCI device ID), but it has not been much of a bother, really. Until last week, anyway, when I figured out that the problem a new Eclipse/RageII user had with graphics modes requireing more than 2 Mbyte was caused by his card having been user upgraded to 4 Mbyte and the RageII driver wasn't prepared for that...

>etc.), so using an emulation to run the BIOS that comes with every card
>certainly looks attractive.

If it is indeed true that many cards make do without much in the way of 386 code, I suppose it may be a workable option. I'm quite surprised to hear they do, though, considering how painful plain 8086 code can be.

The only time I've written x86 BIOS code, I jumped into 386 mode within a dozen instructions or two, even though that made it necessary to also be able to jump back to 8086 mode later. Made things a lot easier, IMO.

You need that. To get TOS up to the auto folder, the card must be able to do at least some basic 640*480 monochrome mode. Fortunately, once the card is set up by the BIOS, this can be done using standard VGA registers that work the same on every card.

Later on, the driver has to program the card for higher-resolution modes, but that is usually documented by the manufacturer (if you get access to documentation at all). Getting the card to a useable first state (like the BIOS does) may require access to undocumented registers to set up DRAM timing, bus mdoe etc..

>For the Eclipse/RageII we "cheated" and simply disregarded the boot up

>you need to connect a monitor to the standard Falcon video circuitry.
>Not really a problem for most users, I think. At least I've not had
>many complaints. ;-)

Not nice, but works. On the Milan, however, there is no other "primary" cideo output which we could use in the boot phase.

>For the Eclipse/RageII we had the same problem (we never tried to get any

This may work, depending on the card - some have write-only registers or registers that can not be read back. We tried this on the S3, but it did not lead to a working configuration without some additional tweaking.

Hello,

I've come into trouble trying to partition many IDE drives from 15 to
20 GB on both my CT60'ed Falcons and my C-Lab MK-I one.
I couldn't succeed so far.
So, could someone (owning CT60 if possible) please try the following :
1- prepare a boot floppy with HD-Driver 8(.16),
2- attach at least a 15 GB IDE drive,
3- boot from floppy,
4- set at least 16 partitions of 8 MB each,
5- try to install the driver,
6- try to access the partition menu again,
7- return here and tell us...

Thanks in advance,

J.-Luc - puzzled :-(

I used the same interface on CT2 Falcon.
If i got the interface new, it doasnï¿½t work in CT2 mode.

Elmar modified the driver to the faster (CT2) rom port timing.
With the modified driver the interface works great on CT2 falcon.

I think you had the same problem.

Regards, Robert

Hi. I've got an 80 gig IDE Maxtor hard drive on my Falcon. I'm using v8.15
of HDDriver. I don't have it put back together yet, so what I say goes a
bit from memory.

IIRC, I used partitions C through P, which is about 14 partitions. I made
them almost the maximum limit under TOS 4.92. I believe it was something
like 950 megs each. (isn't 1 gig the limit?).

This worked. However, again - if I recall correctly, at some point when I
was running HDDriver to set everything up, I had to reboot at least once
for everything to show up correctly.

HTHs.

I think I misexplained : the important is to know what happens when
creating more than 15 partitions, whatever their size should be - even
20 partitions of 8 MB would do.
Could someone please follow exactly the steps I described in the
previous post ? That would really help.
And, again, doing this on a Falcon would be better, and more if using a
CT60, as I suspect the problem doesn't exist on a Milan, Hades or with
an emulator.

Rebooting is required because otherwise TOS cannot access the additional
partitions, i.e. those that were not present before partitioning.
Rebooting is also required when the maximum partition size is bigger
than it was before. This in particular happens when the number of
partitions is reduced, which can result in some partitions having bigger
logical sector sizes than before.

One could say that in general rebooting is required after partitioning.

I would expect the same behavior on all machines because for HDDRUTIL
the machine type does not make a difference. HDDRUTIL does not know
whether it is running on a Milan, Hades or any kind of Atari.

Ah, my apologies, I misunderstood. Unfortunately, as I mentioned in the
previous post, I don't have my Falcon back together yet to try what you
want. :-(

What is the problem you are seeing/having?

Why so much partitions? U may use bigger partitions as 1gb with MINT.
Almost no size limit. Also MINT allows more drive letter as till P: However,
that may be a problem if u need TOSfs partitions. Im not sure if MINTs newfat
file system supports larger partitions as 1gb... Maybe some Magic users can
tell if there is partiton size limit. I am not fan of utils as Bigdos, they
arent as safe as proper os and driver support....

Janez

P.S: Im using 10 and 12gb partitons....

> Why so much partitions?

Because I need so.

> U may use bigger partitions as 1gb with MINT.

I never said I use MiNT, did I ? So, forget partitions bigger than 2 GB.
In fact, I use MagiC! 6.20.

> Almost no size limit. Also MINT allows more drive letter as till P: However,
> that may be a problem if u need TOSfs partitions. Im not sure if MINTs newfat
> file system supports larger partitions as 1gb... Maybe some Magic users can
> tell if there is partiton size limit. I am not fan of utils as Bigdos, they

I need to use more than 14 partitions, and still be able to use the 14
first under TOS. So, it means size under 1 GB for the 14 first, and
under 2 GB for the others (MagiC! 6.2 has problems with greater sizes).
So, again, could someone try and follow what I asked, and tell me if
HD-Driver can or not create more than 14 partitions on a Falcon with
CT60 if possible?
The fact is HD-Driver ought to allow this, and on both my CT60'ed
Falcons and my C-Lab MK-I one, as soon as I want to have more than 14
partitions, the whole disks (I tried 5) become unuseable.

Thanks in advance,

Jean-Luc

Message-ID: <nr34i19c9m2vgt771q2v0pcjg9l1t9aeq9@4ax.com>
Source record: 11334

Hi all,

As I've got rather a lot of questions to post I thought I'd better merge a few into one post. Appreciate these have probably been asked stacks of times but research on the net has not turned up the answers.

What's the quickest solution for transferring files from a PC to an Falcon/TT? I'm going to look into networking my Atari kit but that's a little way off at the moment.

Is the Backwards ST emulator program still available? Would love to play some of my old favourites such as Megalomania. I know that I could use a PC emulator but somehow that seems like cheating ;-)

Has anyone got upgrade disks for Hisoft Basic 2 & WERCS? I contacted HiSoft but was told the master disks have been lost. Currently using HB2 v2.02 & WERCS v1.24

There used to be stacks of PD suppliers (10 years ago) but most have seem to have dissapeared. What's the best place to download PD & Shareware(?) utilities such as ACCs?

Well that's probably enough questions for one post. Have to say it's great getting back into the Atari scene again and away from those Satanic PCs, even my trusty old Alpha workstation running OpenVMS has been consigned to the cupboard. :o)

Thanks in advance.

Dave.

3959. [Computerfest-Announce] Computerfest this weekend

Newsgroup: comp.sys.atari.st
Date: 2005-09-10 04:22:12 UTC
From: Sid Pacman <8-bitter@atari.old.folks.home>
Message-ID: <Pine.GSO.4.61.0509100008460.28534@furyy1>
Source record: 11335
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I just received this rather late bulletin on Computerfest in Dayton, Ohio, this weekend. In past years this show was usually held in August and for a long time it was one of the biggest computer shows in the northeast.

---------- Forwarded message ----------
Date: Fri, 9 Sep 2005 20:57:05 -0400
From: Nancy J. Christolear (njc at dmapub dot dma dot org)
Subject: [Computerfest-Announce] Computerfest this weekend

It's that time again -- Time for the area's largest computer and technology show at Hara Arena, Computerfest(r).

When: Saturday, September 10, 2005 from 9:00 AM to 6:00 PM and Sunday, September 11, 2005 from 10:00 AM to 4:00 PM
Where: Hara Area Complex, 1001 Shiloh Springs Road, Dayton, OH

Computerfest: Still the area's largest computer fair, featuring vendors from across the country offering the widest selection of computers, computer parts, software, and seminars available under one roof.

Dayton LANfest: Having broken all records for the largest computer gaming event in Ohio, Dayton LANFest continues to grow into one of the top computer gaming venues in the nation. This show's LAN Party will feature gaming tournaments for the PC AND X-box. Over $3,500 in prizes and giveaways will be available to the 250 plus players expected to participate. Registration is $35 in advance at www.daytonlanfest.com or $40 at the door.

Intel is offering a rare opportunity to Computerfest® and Dayton LANfest participants.

Need a new PC? Ever wanted to customize and build your own PC using state-of-the-art components at a great price? Then come to Computerfest, where you'll be able to purchase and build your own personal computer at the Build-Your-Own PC Workshops sponsored by Intel.

Intel will be sponsoring 3 build your own computer seminars at Computerfest®. Participants will be offered the opportunity to buy parts for a significant discount and then walk away from the show with a computer in hand. See full details at www.computerfest.com.

Tickets for Computerfest are $7 at the door or $5.00 at our preshow outlets. Tickets are available on line at www.computerfest.com. They may also be purchased at various locations in the Miami Valley

listed on the Computerfest website. Your Saturday ticket also gets
you into the show on Sunday.

I live 20 miles from Hara Arena and plan to attend mostly for seminars. I'm confused as to why this is being posted in Atari newsgroups. Other than SCSI drives I haven't seen anything relating to Atari for many years. It's a good show especially the free seminars but anyone expecting Atari is going to be disappointed. Correct me if I'm wrong.
IIRC their is an Atari show in Columbus this weekend.

Yes, but as long u stay within VGA boundary new CRTs will do just fine. Problems starts when u want to get so called RGB resolutions. Those use 15.7 khz horizontal clock, which is way bellow what VGA monitors can do (better ones craps at 28khz maybe, most cant go bellow 30 khz...) But RGB mode is usefull mostly for older demos and games, since its not eyes friendly in higher resolutions (640*400 etc...) If u need that, best way is to get Atari RGB monitor, or commodore 1084 or Phillips CM8833 (this one is preety cool, esp in v2, has composite and scart inputs, switchable.. u can also use it for consoles like Dreamcast, Playstation etc...) Or NEC3D or similar monitor. Hard to get good one these days...

I doubt that this has anything to do with the CT60, i.e. using a stock Falcon would also be fine. I cannot reproduce this problem with my TT. Creating 30 partitions on the same drive works fine for me.

> a little way off at the moment.

The quickest solution is to share a hard disk drive by creating a
partition on it that can be read/written by both the PC and the Atari.
A hard disk will do for that, a drive with removable media, e.g. ZIP,
will do as well. A CF card can also be used, but this requires a CF card
adapter, of course.

Yes I agree. I have seen them for sale for about $250 which is what I paid for
mine.

I talked with him some time ago so he is still around. What versions of Newswatch and Popwatch do you have? I have version 2.91 of Popwatch and 2.5 of Newswatch. My Okami/Newswatch/Popwatch system are working just fine. I have Comcast as my broadband connection.

On Sat, 10 Sep 2005 at 05:23 -0000, T Shadow scribbled:
->I ... plan to attend mostly for seminars.

The seminars are another good feature of this show.

->I'm confused as to why this is being posted in Atari newsgroups.

Atari is a brand of computer. Atari users are computerists.
This is a large show with lots of things that are of interest to
a great many computerists. 'Nuff said.

-> ... anyone expecting Atari is going to be disappointed.

That has been increasingly true of all computer shows and ham-
fests for more than a decade. But it isn't a good reason for
Atarians to put their heads in the sand and to try to shut out the
rest of the computer scene. There's still a lot at these shows
that's useful to us -- or at least many of us (perhaps especially
8-bitters) -- and then there's always the possibility of finding a
direct Atari item for a song.

->IIRC their is an Atari show in Columbus this weekend.

I noticed. After all, I'm the one who posted the information
about it on this newsgroup!

Hello,

I wonder what happened with the author of Popwatch and Newswatch, Gary A. Priest. Is he still around?

I get more and more troubles to use Popwatch/Newswatch on my favourite OS. I can't use Okami/Popwatch to retrieve mails larger then let us say 25 KB. It seems my broadband connection is too fast for Popwatch. The newserver of my ISP demands user authentication. I know Newswatch supports this but it seems the newsserver demands something more, so I can't send out messages with Newswatch.

One thing I really want to see are newer versions of Popwatch/Newswatch.

Yes. You can get *new* monitors from a specialized place in the US (and I
believe it has an outlet somewhere in the UK), for svga monitors that will
sync down to RGB levels, but man, the prices! Something like $1300-1500
for a 15" to 17" monitor!

If ever win the lottery, I'll get one. :-)

Sure do miss the ability to run older Falcon demos and games, although
svga monitors are sharp and hi-res.

I know that this is a great product, and they have worked on it long and hard.

I just figured out what it would cost me personally (someone please correct me if I got the figures wrong):

100 EURO for the board
17 EURO for shipping
4.68 EURO for the 4% Paypal transaction

121.68 EURO

Which equates out to $151.04 US dollars. That seems a bit high, considering that ethernet cards are about dirt cheap here ($10 or so?). I have Rorys' EtherNEC setup, for around $75 and it works great. I know, I know the performance of the EtherNAT is much greater, doesn't use the cartridge port, etc, etc,... I would really like to have one though. I guess I'll get flamed for even posting this... Oh well. :-(

Just musing... whats everone elses thoughts on this?

3980. Encode MP3 & OGG on TT with Aniplayer?

Newsgroup: comp.sys.atari.st
Date: 2005-09-10 22:36:27 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <43236de233fe750@tripnet.se>
Source record: 11257

I'm having problems with latest Aniplayer 2.22 on my TT running Magic 6.20 related to the various SLB files.

To encode mp3's I need LAME_ENC.SLB but if I try the (only available) 68060 version I get an "68000 exception nr -69" and Aniplayer exits.

The doc's says:
Requirements:
- 68020 or higher
- FPU or 68060
- MiNT 1.15.3 or MagiC 6 or MetaDOS 2.74.

so I should be fine with my 68030 with fpu but it simply doesn't work at all!

However... if I use the older Aniplayer 2.20 LAME_ENC.SLB it's OK! Both the 68060 and 68881 versions work (68881 slightly faster).

The 2.22 version is compiled with Gcc 3.3 and 2.20 with Gcc 2.95.2.

It's also interesting that the same happens with AVCODEC.SLB when encoding mp2: 68020 (Gcc 2.95.2) is OK but 68060 (Gcc 3.3) exits with the same error -69. Here both versions are present in the aniplayer 2.22 package!

So far by mixing versions I'm able to write both mp2 and mp3.

To encode Ogg files VORB_ENC.SLB is used but unfortunately there is only a 68060 (Gcc 3.3) available in 2.22 and non at all in the 2.20 package. This version also exits with error -69, so at the moment I'm unable to encode Ogg files with Aniplayer.

Anyone with better luck on either TT or 68030 Falcon??

No, I mean partitioning a ZIP cartridge so that you can use it with both
the Atari or the PC. Write data on the ZIP with the PC, then use the
cartridge (in another ZIP drive, or the same) to read these data with
the Atari. Or write data with the Atari and read them with the ZIP.
There is no network connection. The data are shared via the ZIP cartridge.

From their website (http://nature.atari.org/):

EtherNat
Ethernet and USB card for the CT60

This board for the CT60 expansion port gives your Falcon 100 Mbit Ethernet and USB 2.0 support (low/full speed)
Background
Using the existing LAN adapters for the Falcon, you should be able to get approx 400 Kbyte/sec. The problem is just that you have to use the cartridge port. This seems to be a great problem for us, because none of the cartridge ports of our falcons are healthy. This results in ~5KB/s transfer rate for us when using the EtherNEC. In the summer of 2004 we grew tired of this and started designing our own network card for the CT60. After a while Rodolphe persuaded us to add USB functionality to the board as well. So in the end the EtherNat ended up to be an Ethernet+USB board for the CT60.
Ethernet features
* 10/100 Mbps Ethernet using the SMSC LAN91C111 controller.
* Mintnet driver for Ethernet. Should work with Magicnet too.
USB features
* 2 channel USB 2.0 support using the Philips ISP 1160 controller.
* Low (1.5Mbps) and Full (12 Mbps) USB speeds are available.
* Uses an USB header cable to let you place the USB connector in your Falcon/tower case where you want them. Bought separately.
* USB driver developed by Jan Thomas. Homepage
* USB peripheral drivers developed by YOU.

and to be fair, I forgot to mention that the EtherNAT does offer USB
support as well. My apologies.

Ethernet cards are dirty cheap. They also are produced in BIG quantities using templates to make production even cheaper. I doubt any of those companies woud be able to design a card from scratch, for a strange machine, and produce 100 cards for less money as Nature (or Rodolphe with ct2/60 etc) did. U dont get just ethernet card, which anyone can buy, no matter what the cost is. U can buy really expensive GFX card, u still buy mass product. Here u get rare piece of equipment, done in small series. I only have 1 PC, and money spent in Falcon is still less as i spent for PC. Difference is my Falcon gets faster and more useable every year, PC goes the opposite way..

Personaly, i never regret money i spent for those odd devices.. After all it is only money, and if have to earn it hard, lets spent it for something special, 100E is not that much ill go bancrupt, or make me rich after all. And my experiences told me, that if i would not buy ethernat, enec etc, money would be spent anyway, proly for more foolish stuff ;)

Interesting test. Have you contacted the author about this issue ?
I might have a similar problem on my Falcon030/CT2B+68882. I'll try using
the codecs compiled with gcc 2.95.2 and see if this fixes the problems I'm
currently having.

Yes, provided that you have partitioned the ZIP cartridge with a special
option offered by the HDDRIVER package. This option creates a partition
that can be used by the PC as well as by the Atari without any
additional software.

> Comcast as my broadband connection.

I've the same versions of Popwatch/Newswatch as you.

I really think it's a speed mather. I've 3 computers (mac + linux box
+ Hades) connected to a router. If I let the Linux box download/upload
a large amount of data I can get big mails on the Hades because the
connection speed on the Hades isn't that high anymore.

A while ago Erik Hï¿½ll tried to explain me why Popwatch gets in trouble
but alas my memory seems not to be that good anymore.
I believe it has something to do with the CNbyte_count() call that
returns a large number which Popwatch sees as an error.

Earlier versions of Mymail were suffering the same problem but Erik
has solved this.

I'm using the cable and according to a speedtest it's running at 2545 Kbps

If you ever get in contact with Gary again please ask him to release the
sources. A good home for his soft would be TOPP (The Orphaned Projects
Page) <URL:http://topp.atari-users.net/>

I agree with everything you're saying Janez, absolutely. I've spent much
more on my Falcon *recently* but it was worth it, down to the very last
penny. Overall, I've spent much more on the hardware needed for the 3
Linux comps in my home LAN.

I guess I'm really just whining/complaining because after buying the CT60,
Rev6 CPU, CTcm, and Wizztronics rack case, I don't have money left over
right now to buy the other super cool things that are coming out.

Does that make sense? :-)

Well i cant judge for yourself :) I have ethernec running fine. And im not interested too much in USB part of ethernat.. But it wouldn't make sense on my side if i would let it go :) I'll try to get Ethernat ans a CTPCI, altough wages here are quite low... :)

You will just have to judge if i can get Ethernat or CTPCI or both :)

>Is there an English version of Splitter? The only one I could find is
>in German.

Yes, there is. Do you want me to send it to you? It's just over 100 kB
and includes both Atari and PC-DOS (286 and 386) versions. It was
first published for Atari ST User magazine and included on ST Club
disk DM_43.

But your problem could perhaps also be solved with ZIP-Split and
ZIP-Rebuild. To quote from the instructions:

'The aim of ZIP-Split and ZIP-Rebuild is to recover ZIP files for
which ones ST-ZIP says that they are "damaged or not a ZIP file at all".

'ZIP-Rebuild will explode the ZIP file in as many files as the
original ZIP file contains. ZIP-Split will uncompress the archive.

'Don't expect miracles from ZIP-Split/Rebuild. They cannot rebuild
the data. They will only process the parts of the archive that are
uncorrupted.'

HTH

Does anybody know how the USB driver works? I just wonder if one can
connect CF cards to the Falcon by using a stock CF card reader/writer
for the USB and then use the CF card like a hard disk.
This would probably be a more convenient solution than connecting a CF
card adapter to the IDE port.
A SCSI driver implementation for the USB port would be needed to get
everything working, but this may be an interesting programming project.

There isnt one yet. I am currently looking at how to implement the mass storage class. I think the best way would be to have the driver for the mass storage devices boot BEFORE hddriver, so hddriver can find any hard disks and use them with the standard command set. Hopefully this would not entail a re-write of any of hddrivers code to support them...

Coda.

>>
>
>Interesting test. Have you contacted the author about this issue ?

Just did.

But some of the SLB README's clarly state:
"compiled with Gcc 3.3 with -m68060 and libm2060"

and older ones:
"compiled with Gcc 2.95.2 with -m68020-60"

so it looks like 68030 support got dropped in the last 2.22 version. It's
really a slow process to encode to mp3 and ogg files. About 100 minutes
to get a one minute file but still useful if you are not in a hurry...

They say "slow food" is good for your stommach so maybe "slow computing"
is good for your brain :-)

>I might have a similar problem on my Falcon030/CT2B+68882. I'll try using
>the codecs compiled with gcc 2.95.2 and see if this fixes the problems I'm
>currently having.

I have now managed to get both mp3 and ogg encoding working by combining SLB's from Aniplayer 2.20 (LAME_ENC.SLB), 2.21 (VORB_ENC.SLB) and 2.22 (AVCODEC.SLB).

The older versions can be found at:

http://perso.wanadoo.fr/didierm/files/anipl220.zip
http://perso.wanadoo.fr/didierm/files/anipl221.zip

This can definitly be confusing to anyone as you also have several different SLB versions in all three Aniplayer versions...

No, on the contrary: That's the only way it would work. Implementing a
SCSI driver for mass storages devices is basically the same approach as
the one used for PCI SCSI on the Milan: The driver must be made
available before the hard disk driver is started. The hard disk driver
will then automatically detect and use the available devices.

IIRC it is just a VGA monitor, with the horizontal shift set up for the
TT (Via a switch on the rear). In which case the Falcon won't do more
than 640x480@256 colours, without help (screenblaster, Centscreen, etc).

Thanks Mark. Hmm, according to that, it can't sync down to the ST range so it couldn't do the early Falcon RGB demos 'n stuff. Too bad. Its almost impossible these days to find a monitor like a Nec3D that will do it all for the Falcon.

I did find a place, but they are "specialized" which means low volume, or in other words *very* high prices. Something like $1300-1500 for a 15" to 17" monitor. :-(

You could look at an LCD with both VGA and composite/svideo inputs.
Dunno how the Falcons whacky rez's would go though.

For quite some years now im using external VGA TV tuner, works like charm
for Falcon RGB, 8 bit machines etc.. I just make cable to get Falcons
composite out and that is...

So the question is, does the bootsector on the hard disk contain any HDdriver code, or is it just a loader for hddriver.sys? Can I replace the bootsector so that it loads my mass storage class, and have that then call hddriver.sys?

Who is your ISP? Ever since Comcast increased their overall connection speed,
my Hades just flies on the connections. I can download about 1000 messages in
about 2-5 minutes using Newswatch. That suites me.

I actually looked at some of those, with the TV stuff built in because it
seemed like it would work. I just hated to invest that much money to find
that it didn't!

Anyone ever use their Falcon with the LCDs with a TV tuner? Does it work?

This code (the same applies for any other hard disk driver) must not
only locate and load but also relocate the driver binary. TOS cannot do
that at this point. It also checks (as far as I remember at the moment)
if the ALT key was pressed, which will prevent booting from hard disk.
Except for the name of the SYS file the boot code does not differ much
between the different hard disk drivers.
The safest bet in order to be compatible with anything is probably to
save the contents of the root sector before modifying it for the mass
storage device and then load and execute it when the time has come to
load the hard disk driver.
Modifying TOS to initialize the SCSI driver for the USB appears the most
elegant way to me. After initializing the SCSI driver the standard TOS
boot sequence would simply continue and takes care of anything else,
including bootstrapping the hard disk driver.

Hi All,

I have the ctcm and the 060rev6. I printed out the photo (from czuba's site) of the ct60, but I can't find the area on the actual board which is designated in the photo, which shows where the wire for the ctcm are to be soldered.

Can anyone clear this up for me?

Thanks,

This is the way for the CTPCI.
PCI_BIOS -> SCSI_DRV -> boot with driver who support SCSI_DRV.
There 512 KB of flash on the CT60, so it's not a problem.

Regards,

Didier.

But if Gcc compiles with the flag -m68060 the code will not run on 68030?

Don't know if your README is correct but if it is I suppose the flag
-m68020-60 would fix the issue on 68030?

Hey guys,

My falcon is just itching for some good video. The EtherNAT is now paid for, so now I have to ask the question. How soon will the EtherNAT's be manufactured? And afterwards how soon will they be shipped?

Okay now what about the CTPCI? I'm hoping that I will be able to put an ATI Radeon card in it and use some good video modes until the supervidel is done...

And what about the Supervidel? Any progress?

Thanks,
Mark

> Would this be true with the analog LCD panels that have VGA input?

VGA input probably only accept VGA standard (SVGA, XVGA..) so probably
between 30-50Khz, specific rate must be specified in product info sheet.
Problem as i see it with LCD is fixed resolutions. That means that display
will be either small on LCD, or resized and not very sharp. Also, some apps.
demos and games, use own resolutions, some even switch them a lot, which add
to the problem. Thats why i prefer CRT personaly. In combination with external
VGA TV tuner (avermedia JoyTV) works very nice. That way u can watch TV,
Falcon RGB, ST low/med, etc, etc.. without much hussle..

It seems that the OS on Amiga is far better than on Atari...
I just hope that some news things will arrive on atari to reduce this
incredible difference !

I donï¿½t get it!

Did you saw AMIGA OS for first time?

Or what do you mean "incredible difference", scrolled screens?

The other day I've had an AICQ discussion with Paul Williamson
(Briton) about the meaning of "some time ago". It seems I've another
idea about that as he does. According to me "some time ago" means
recently, not that long ago. Pauls says it rather means not recently,
quite a long time ago.

So some time ago does this means weeks, months of years? AFAIK nobody
he seem of spoken to Gary since at least a year (probably more).

My ISP is Telenet Belgium, AFAIK the only ISP who offers cable. Cable
is faster then DSL.
Mind you I can't use Newswatch to send messages out because for some
reason it fails in User Authentication. Retrieving messages is not a
problem and goes really fast.

Popwatch OTOH fails to download large mails (25 kb and more).
Sending out large mails doesn't give me any problem.

Popwatch returns me a warning like this:
RETR 9
+OK 8403382 octets
CNbyte_count= -27952 Unrecognized error

I've owned a couple of Amiga models (A1000, A2000, A1200). They are okay.
I still much prefer the newer versions of TOS and an accelerated Falcon.

;-)

PS BTW, hasn't OS4 been "coming" for a very long time? :-)

Well, drivers come with programs, if you want to print from a
program, and NVDI provides printer drivers for programs that
will print to it. Need more information.

If you have an inkjet that will only print bitmaps, you need
a program that outputs bitmaps to a printer.

Need much more information.

I've not seen a Falcon with a 680x60 board, but hey Amiga OS4
pre-release 3 is running on a PowerPC chip.
I don't think that there's competition there :) (I'm not trolling at all
its just the truth.)

Beside that I love Super Sprint on the Atari and it was never ported to
the Amiga, I'll maybe do the port myself one day.

Elemental is great too!
Its clear that the original Amiga was did have a better hardware, but I
assume that ST coders were the best as they've to do all stuffs in
sotftware on the original ST at least.

There is a lot of eye-candy in AmigaOS4. Once we get some faster
graphics hardware we could have some of that too, hopefully.

Personally, I don't think you should underestimate FreeMiNT/Xaaes. It's
a really mature operating system which runs quite smooth on the CT60.
Try the latest alpha version!

Perhaps we lack a real "turnkey" distribution. EasyMiNT is really good,
but you still have to do some stuff manually to get a smooth running
system with all the goodies.

regards

Well, in my point of VIEW, theres a BIG HOPE, a MyAES, really solid piece of OS, and with DIRECT Desktop its look very very good, so what we need its to support these!

Anyway, a TRULY EASYMINT! is for sure better way to promote MINT!

Eye-candys are not the central point of OS, but they are very useable, its much better when your OS looking good.

I agree fully with you here, FreeMiNT/XaAES is at this time the best option to proceed for anyone that wishes to have an up-to-date OS on their Atari/clone/emulator. It is by far the most stable and complete AES that we have at our disposal right now, and the eye-candy area is being looked into. As Peter noted, anyone who has yet to test latest XaAES public alpha should definately have a go at it and have a look!

And yes, what is left of our platform would definately benefit from a really solid distribution. A distribution that could make a transition from MagiC over to FreeMiNT as smooth and less problematic as possible.

Regards,

/Joakim

Does not happen like that on my end. Sounds like an ISP problem/compatibility
thing. Now and then Popwatch fails the authentication when signing on, but
after a while, things are fine.

Well, atari market is very small, and amiga one is still quite big, so even HAWK will arise I think its bring more cons than pros.

The best way should be NEW 68k FALCON, like PHENIX! but more compatible with FALCON. And Ct60 seems to be very good predecossor of new FLACON MOTHERBOARD with SUPER VIDEL graphics card.

We donï¿½t need PPC! Amiga is different! If you need PPC its mean you need full emulation of atari, so wheres the point of new atari PPC CLONE?

You can get very cheap MACINTOSH with POWERPC and install EMULATOR ON IT!

I totally agree with you. I'm using FreeMiNT/XaAES on the Hades since
quite some time now. Before I was using FreeMiNT/N_AES 2.0.0 but I
really don't have any reason anymore to go back to N_AES. XaAES runs
very smootly. All the apps I use daily, except one, are working like a
charm. There is a small redraw problem with Okami but AFAIK, that's
due to Okami and not XaAES.
>

Personaly I prefer to do things manualy. This way one knows what to do
if something goes wrong. Anyway I used the EasyMiNT installation too.
Compared to previous installation kits EasyMiNT is a piece of cake.

I did once a Magic Mac installation and I found it very hard to get
things right.

Yeah, I used to have a few incompatible apps too. There are quite a few of those on our platform, unfortunately. There is no way we could compensate for that in the OS without sacrificing something else.

Personally, I have choosen to ditch the applications that won't work right away. I think that's the way to go - not to invent workarounds in the OS all the time.

> Personaly I prefer to do things manualy. This way one knows what to do

Actually, I have nothing against doing things manually. However, every new FreeMiNT user has to reinvent the wheel, and there is no point in doing that.

Guys, I'm trying to find the complete text of the Atari ST quick FAQ. Or any Atari ST FAQ. Full size would be even better. I google searched it, found a lot of dead links/pages, as well as several that points to Martin-Eric Racines page. But I can't find anything on his site to do with Atari.

I also would like to find a TT030 and Falcon FAQ if possible.

I'd like to put them up on my BBS.

Thanks everyone!

The main programmer of MyPDF, Rafal Kawecki is now out of bussines.
Unfortunetly one who got all SOURCES now is ME :)

I dont think MyPDF will went ahead, simple because Rafal dont have ATARI anymore :(

So bad, because indeed MyPDF looks very promising, especialy GUI, which was wrote with Eric Reboux Library (XGEM, DIRECT,MyAES), a great piece of software for programmers and users.

Hi,

> Well, atari market is very small, and amiga one is still quite big, so even
> HAWK will arise I think its bring more cons than pros.

This is the reason why i always ask for use a existing board instead of
develop one only for the atari market.

> We don't need PPC! Amiga is different! If you need PPC its mean you need
> full emulation of atari, so wheres the point of new atari PPC CLONE?

For more CPU power. This will open the door for new ideas of applications.

If you look at the web there is also sometimes the need for more CPU power.
From time to time i have seen websites which requires more CPU power than a
80486 or 68030 has. E.g. some people have pictures but dont scale them down
for thumbnails, instead there is only the width and height attribut in the tag.
And my computer has to do the work. On my additional 200 MHz Pentium on work
this took more time than i expected for this site. The same with ebay. You
need a slow pentium as a minimum to process the java script.

If you dont want to wait the whole day to convert a cd to mp3, you also need
a little more power than a 68030.

And what about video?

You can have plenty of ideas for more cpu power.

Regards
Michael

Yes, developing or rather administrating all the payments... ;) And I
usually don't check this news group very often.

When we have received enough payments to ensure that we can afford
producing the EtherNat without risk of going personally bankrupt, we'll
start the production. Unfortunately the production in itself means
about 6-8 weeks time, because some components for the EtherNat aren't
in stock at our suppliers. This was the case the last time we checked
at least, but we've noticed earlier that this may suddenly change for
the better. So we prefer to give you a worst case estimation instead of
any "false promises".

Regarding the SuperVidel we hope you realize that we are only two
persons, who have to work to make a living, so development is
restricted to our spare time. Because of the EtherNat the SuperVidel is
on ice, until the EtherNat is out the door. But we have still had some
time to think of improvements for the SV, so when we're taking it up
again, we'll know what to do.

/Henrik

It is good that we have two free alternatives; I think everyone will
benefit from that in the end. We need to support both, and help the
authors in any way we can.

Hopefully, Odd Skancke and the Myaes authors get along and talk to
eachother, so that compatibility between the two AES flavours won't be
an issue..

Hi!

I have had more attractions in the time, I used the AMIGA. But maybe
bez. I was seven or so, when I used the ATARI.

With the Atari TT I have, I doni¿½t know. I do not use it yet. For now,
the TT is laying around, half opened (LED must be repaired, they were
so rusty that they broke without many touching). But it is prepared.
Maybe I will get attracted again with the TT :-)))

Kind Regards,

Daniel Mandic

P.S.: ATARI

What model? Usually with the TEAC there are solder pads on the underside
of the drive. They are listed as ID0 and ID1. Move the SM resistor 90
degrees. It is only a wire (0 ohm resistor) bridge, so if you want you
can bridge it with solder.

Well, I have to admit...I met my wife (partially) on my BBS! True story,
although I had met her casually at the grade school where her son and my
son attended.

She began logging on to DarkForce and we started chatting...and one thing
led to another. :-)

Henrik,

And of course I understand you guys are just two people and I understand the limitations that real life creates for such projects. When the CTPCI was announced, it got my hopes up because I realized I had some sort of high resolution video solution while I'm waiting for the ultimate solution, the supervidel. So I guess we'll see ;)

A LITTLE more ? I have once tried to convert one little song to MP3 using bladeenc on my Falcon030 before I had a CT2b board, fast RAM, and a 68882 FPU. I actually succeeded but I'm afraid you need even more than one whole day to convert a complete CD to mp3 on such hardware. I now could do this much faster on my Aranym box. But why should I if I can do it even faster on the Linux host OS that I'm using to run Aranym ?

Perhaps its because he doesn't have anything but Atari hardware? :-)

Seriously, I use Mandriva Linux on my 3 comp LAN at home, but until 2000+,
I only had Atari hardware in my home as well. Proudly, I can say that I've
never owned any MS product...

Fate willing...I never will.

Hey guys,

I know these may not be the perfect groups to ask this, but I have been dying to get my hands on a copy of Battlesphere. Now anyone who watches eBay can clearly see the prices go into the $500+ range. Now I know I'm not going to want to play this game for very long, so I feel I don't need to own it.

Therefore... I was wondering if someone could rent their copy of Battlesphere to me for a couple weeks to a month. I'd be willing to pay $20-$40 or something that's fair for this service. I imagine many jaguar owners would be willing to pay this too ;) I have references so you know you'll get it back and you know I'm good for the rental money.

I'm in the US, but that doesn't really matter much for something like this.

Thanks,
Mark

I too have a copy of xgem. I tried unsuccessfully to convert it to
compile with gcc. Now that I have knowledge of certain tools to do this
(fvdi conversion was successful), I'm thinking about trying again. I was
going to use this library for GIM, but to be honest, I'm glad I used
windom instead since it's such a great easy high level lib.

I wish Eric would be more happy with GPL so we could import the good parts
of XGEM (fonts, asthetics, etc) into XaAES so all programs could benefit
from those features. I really haven't ever seen anything more pretty than
xgem programs like find it and myPDF on Atari... Sorry to other lib
creators ;o)

Thanks,
Mark

My girlfriend gets hot for my falcon. Just kidding ;) But if it wasn't
for Atari, my life would be arguably crappier ;) I wouldn't have met my
best friend of almost 10 years now. I met my current girlfriend of almost
5 years through him. So who knows where I'd be without Atari ;) I also
wouldn't have anywhere near the level of skills I have if it wasn't for
Atari. The machine inspires me.

Thanks,
Mark

Hey guys. I just won a Compatibility 2 plus off ebay for a great price.
Only problem is, there are no docs included.

Anyone have this device and be willing to photocopy them and e-mail/snail
mail them to me?

I'd be perfectly willing to reimburse anyone for the trouble. I already
tried a dealer in the US, they said everything from Wizztronics is
copyrighted so they can't legally do that.

Thanks everyone!

Hey Mark,

Get a cheap flight to the UK for the weekend 22-23 Oct, and come to
Jagfest UK. You can play Battlesphere for two days solid if you like...
;-)

Or you may be able to persuade one of the owners to part with one for
around $250 equivalent.

Coda.

Just like me. I have never even Bused MS Word, MS Explorer, MS Excel, or
MS Windows.

Only recently I have started using Linux on a second hand
laptop. No dual boot together with MS Windows, or Knoppix CD, just Linux.
I have installed ARAnym on it and have a lot of fun both with the Atari
software and the Linux software. And my Falcon030/CT2b is still doing it's
job fine also.

Yes, saw those. I talked to them by phone this morning. Get this, they are closing down for about a week to go help with the Katrina problem in LA.

Kudos to them!

After that, the person I talked to (Steve) said he should be able to copy the docs and get them to me. Great bunch of people there.

Now I just have to be patient for a couple of weeks. :-)

Thanks.

The TT high res outputs ECL signals (emitter coupled logic) which are not VGA compatible. You can't display TT high res on a VGA monitor without an external converter. I don't know if this kind of converter still exists... However, you will find here info about VGA to ECL conversion (http://users.tkk.fi/~pelle/vga-ecl.txt), try to do the reverse ;-)

Don't forget Calamus with the Calipso module! Latest version is 3.21
dated 13/7-2005 if you like fresh software.

Add to that Bridge 6.07 dated 29/8-2005 and you can make your own pdf
documents as well.

Calamus is not for free but you really get a very competent dtp
application that will at least run both under MS Windows and Atari.

4102. toasting MiNT, yet again

Newsgroup: comp.sys.atari.st
Date: 2005-09-17 23:45:17 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <dgi9qdeqp1@reader1.panix.com>
Source record: 11179

Here it goes again. Had MiNT up and acting stable for about a week. Gave it a clean shutdown, and when I restored power and rebooted, my external drive had lost its name. It finally got it back when booting into single TOS. For this I blame the kernel, which has not screwed up before.

For not being sure, I blame me. I do have Egale, and could have compared kernel copies. Did give my auto folder a fresh Easymint copy, and now MiNT is happy again, but I did lose a lot of data. Darn.

Some printers have their own drivers, while SpeedoGDOS and NVDI were multipurpose printer drivers.

Unfortunately, most modern printers have drivers that don't exist for Ataris. Look for "Epson ESC/P", "Epson LQ", "Epson FX", "PCL3" and "PCL5e" emulation modes. I would think the Brother and HP laser printers would be the choices most likely to work today, although there are some reports of other printers working to some extent.

Well, I'm typing this right now on the WinXP laptop assigned to me at work. (It's Saturday at 6PM, so I'm not that concerned about being on the company's "dime".) More than anything, working on Windows here has convinced me not to bring one into my house.

Galen (now up to 6 Macs, 2 Falcons, and 2 STs -- the Falcons do most of the work)

anyone, ever?

Nope. The Atari IS the "other woman", as far as my wife is concerned.

The problem with Battlesphere is that the group (4Play) never really had a marketing guy. (Well, they had one, but he bailed long before the game was out.) The game was finished (IMHO) simply because they didn't want to give up. After it was done and polished, actually selling it appeared to became an afterthought.

I wanted to buy a copy of Battlesphere and would check in at their website every month or so. Then one day I checked in to discover that they were sold out. Rather disappointing, to say the least. There was later a small second run, but they had some problem finding components and the available copies went for far more than the $75 I was willing to pay.

I'll probably never get a copy now, as the programmers have moved on and apparently have no interest in another run. I think the total number of copies out there is under 200, if memory serves correctly.

Are you kidding?! $500 for battlesphere?!

Did you check some of the retailers that still have Jaguar stuff? I'm sure that I saw one last week(can't retrocomputing? or something similar maybe) for $5 IIRC, and AvP for ~$25...

(Also read a review where someone gave Kasumi Ninja a decent score, as opposed to the nearly universal lambasting that I've seen virtually everywhere else... Personally, I think it's OK, but not as good as it could/should have been as with many of the Jag games...)

Wouldn't this have been better posted to one of the Jaguar groups anyways?

Actually if you look in the top level of the ST section the maintainer requested response from archive users and apparently got more than he expected. I suspect that the site is safe for a while yet, besides it looks to be mostly duplicated by every other free/shareware archive any more.

(I remember when it used to be THE site as well, although it seemed to have been missing quite a few items as compared to the old online services(GEnie, CI$, etc).)

The Apple2 & 8 bit sections I think have definitely be superceded by other sites, although GS stuff seems to just be generally difficult to find. (I suspect that the paysite syndicomm has more stuff stashed, but I'm not going to pay $35 to find out or for the "privilege" of using their forums.)

Yeah, I ain't paying for that. There is some site, called "What Is The
Apple IIgs" or something like that, with lots of software for the IIgs,
and there's ftp.apple.asimov.net which is the "definitive" Apple][
software archive. I wonder if there's anything like Asimov.net for the
ST.

Are you kidding? Kasumi Ninja rocks. I still think it was a humongous
joke. I mean what other game could you make a guy shoot fire from under
his kilt!!!!!!!! The cheese factor is through the roof, making it a total
joy to play ;)

Pathetic. They can make a jag cd version now that the encryption is
broken. This reduces the price to very cheap ;)

Actually Galen I heard the amount made was somewhere around 2000, but that is still a small number. Too bad someone cannot buy the rights and make some. I would think many would like to own a copy. I wonder what happend to T-Bird?

Yeah, this is exactly what happened to me. I am working on re-intalling it.
Strange things keep happening when I try and run Mint. My Mint.CNF file and
other files on my TOS partition in my Mint folder are messed up after I try
and boot it. I boot Mint many time and now this.

I'm having problems finding it on the 'Net. I found the
"comp.sys.atari.st" version. I found a 4 part version from somebody named
"Nick Bales". The first part of it is in French. I tried running it
through babblefish, but it still didn't come out very clean. I appended
everything legible I could find together, with notes, and added them to
the main menu on my BBS, leaving all credits in place.

Whenever others can supply newer info or I can find it, I'll update as I
can. Even though its older, it still does have useful info in it - what
seems to go out of date is things like links to web pages and companies
that are no longer around/in service.

Thanks.

I wonder how you managed that. I'm been using MiNT (stable and beta
versions) since 1995 and sofar I never have lost any data. For me MiNT
has proven to be rock solid. Right now I'm using MiNT kernel 1.16.3
and XaAES (latest CVS build) without any hasle.

But as always make backups on a regular base.

Guys, is there anything that needs to be adjusted to let telnet work with STing? I've got Rorys EtherNEC on the Mega ST running my BBS, and I can't telnet *in* at all - I always get a "connection refused".

I can use CAB to access the 'Net with no problems. I can ping out, and from other comp

-- s on the LAN I can ping the Mega ST. So thats working.

Any ideas? Thanks.

No, assuming your BBS is written to use STinG for tcp/ip connections.

You may use TUR_GEM to check if your BBS application is really listening
for incoming Telnet connections.

Get it from:
http://obooklage.free.fr/Atari/index.htm

: http://www.againsttcpa.com | In 2002 began the war for digital freedom

Nope, happened again, and it was not the kernel. (bottom posting looks
silly on a large monitor) My external drive announced itself as HP 9*CB A
80)S1A0 instead of the normal HP 9.10GB A 80-S1A0S1A0, and did not read.

I rebooted in single TOS using HDDRIVER.PRG, again and again, until I saw
the right ID, and then booted into MiNT, which is working fine right now.
Hddriver, several times, read the correct ID on a bus scan, and not on
booting.

I did wiggle connectors, and will probably hear about terminations, but
now suspect the drive has a bit of a problem. It has been happy
for quite a long time, and that is unusual for me. And, this connection is
with pppd, so MiNT is happy and well.

Egale found two copies of the kernel identical, so apologies are in order.

So something is flaky, and the drive is the strongest suspect.

The connector or the cables are most likely responsible. Looks as if at
least 1 bit on the bus was corrupted during the data transfer.

Thanks, I downloaded it. Any chance you can give me a "down and dirty"
most used list of commands? Most of that site seems to be in another
language and unfortunately, my language skills are sub-par. :-(

One point maybe: Our OS-es (TOS, MiNT, Magic) are not BETA ;) Real stuff, so
so far there indeed is incerdibile difference: we can use our OS-es! ;))

I have. All of the web pointers for this FAQ point to a site with a guy who appears to have the same name, but zero about Atari on the page. (Actually looks like an "I Love Me" site trying to support his tech creds, which apparently don't look so good...)

Hey, I found that one too! (Although at the time I was searching for something else and got an English part first.)

Didn't anyone ever download or otherwise save a more recent version from the "maintainer"'s site? In the future it may be wise to archive it somewhere, i.e. maybe one or two of the Atari sites could setup a CVS or subversion repo, then encourage documenters to save duplicate copies there as well as on official sites. (A sourceforge project may also work for this, but I'd think that an Atari site would be better... fewer restrictions on content...) Actually, I'd think that pretty much all of the existing Atari documentation probably should also be dumped into such a repository... esp. various tech manuals, hacks, etc.

Yes, not pleasant. But u can not blame MiNT for that. If anything mess your boot partition is prolly bad drive, tosfs (FAT) related problem (like fragmenting etc), still if it happens oddly and randomly after clean reboot, its most likely drive/cables problem.. in some 10y those probs were responsible for mine MiNT related probs, i still use minixfs partition on TT, created in 96 though :) I think you both have something fishy going on... Check drive/cables!

AFAIK, this is not a MiNT problem. As said in a previous message I'm
using MiNT since 1995, first on TT and now on Hades. In all these
years and despite I've been using (and still using) beta version of
all kind of programs - MiNT and XaAES included - I never have lost any
data or got corrupted partitions. To be honest long time ago one
partition got messed up from time to time but this was caused by
Newsie (log file). But since the day I stopped using Newsie I never
got any corrupted partition again.

The boot drive (partition C in my case) is the only drive which uses
the old TOS format. All my other partitions are NEWFATFS with VFAT
enabled or ext2fs.

You must search the cause of your problem somewhere else. Maybe MagiC
does something weird with your boot partition, who knows.
One thing I'm pretty sure off, **MiNT is not the culprit**.

They actually can not make a CD version.
Or, at least, ther are not willing to.

They developed the game with Cartridge in mind, and they stated it would be
a complete rewrite to make it for CD.
Then, they also lost interest in Jag, I think mainly because of their own
real life, and also because they have been flamebait-magnets in the jag
community for lots of misunderstandings, and also for TBird's attitude IMO
:-)

Well, I was lucky and snagged what I hope to be a working 1040STe as Mega STe's look to be not on the market in the U.S.

In theory had minor water damage, but seller claims it works and boot. i.e. should be fine as it must have been allowed to dry, but I'll have to check for corrosion. Also supposedly is 4M and TOS 2.05(wow, a pretty modern TOS), and a Fast ICD hd(now have to find where I put those old drives and whether or not they'll need adapters...).

Also, at the same time I saw another odd entry on ebay ended around the same time as the STe: A Mega ST4, whose seller claimed a 4096 color palette yet only having the YM-XXXX sound chip, and a 30M Atari hd. The thing went for $255! (Don't some of the dealers sell for less than this? And it makes me afraid of what a Mega STe would go for, let alone a TT or Falcon...) I'd bet that shipping on it was c. $50 as well...

Just as a counterpoint two a1200s went for: $102.87(pretty much a basic system with hd), and a second NICE one with a 030 upgrade and IIRC 10M(and a bunch of other little nifty upgrades)went for $120 from the original owner. (The commentary on the item even sounded like the original owner, as opposed to the others...) Now compare this to a guy selling an a600 for $150 base model on the c.s.a.marketplace group...(Amigas must be more common in the US, as frankly all of these systems are pretty much comparable to the TT or Falcon... and <ducking> better with the custom support chips... Too bad the Tramiels were too cheap to keep the Atari R&D group to finish og little things like Amy and some of the other custom chipsets...)

Funny to read this. My ARM-powered machine will batch convert a CD to MP3
(with -abr 160) at about 0.18 play/encoding time ratio, but this is under
Lame. So converting a 1 hour album would last 5 hours. All that achieved with
a FPU-less CPU (200 MHz, no DSP) !

I know BladeEnc is much slower (and reputed to be lower quality) than Lame.
It'd be interesting to know what Lame can do on your hardware.

Improvise. Video repair shops etc. Or failing that, a nice bright
yellow carefully selected elastic band.

Not sure how to help on originals. This world is obsessed with selling
you something new that doesn't quite do the job, and charging you for
spending your own money.

IMHO, the basic chipset does not stack up against a Falcon. I owned an
A1200 as well - not as good a machine as the Falcon, again, IMO. :-)

Hello again,

I'm thinking of using a standard PS2 mouse & PC keyboard through a manual KVM on my TT. I've seen on Ebay (PeST) a way of plugging a PS2 mouse into the normal Atari mouse port but if I get rid of the TT keyboard where do I plug the mouse in? Is it possible to use a PC keyboard on a TT?

Anyone out there using this kind of setip?

Thanks in advance
Dave.

You can use Eiffel interface to connect both ps2 mouse and keyboard.

Had a look at Eiffel but the picture suggests that it needs to be
plugged into the ST/Falcon motherboard(not mention of TT). Is there
no wholly external solution?

Dave.

It's a very small wire only adapter to adapt that motherboard connector
to the TT's phone jack style connector. I built one of these to connect a
Mega ST keyboard to my falcon. Nothing to it. I'm sure if you have
someone build an eiffel for you, they can put on the appropriate
connector. The QWERTYX has this connector already but only supports AT
style keyboards (SOME ps2 with adapter) and only serial mice, so this day
in age it's pretty useless. Plus it's not compatible with CT60. And,
good luck getting ahold of one. I can assure you that for your needs, the
Eiffel is your very best option.

Thanks,
Mark

The atari machines are getting quite rare in the US. With musicians
picking them up for the YM chips and nostalgia people for games, their
value is skyrocketing. A 4 meg, 16MHz STe of any variant really is worth
almost as much as a falcon anymore. Mega STe's don't fetch as much
comparatively.

I've found that people are willing to pay a substantial premium for a
machine that is *complete*. As in MagiC, NVDI, Extendos, and all the
other useful utils, Monitor, hdd, pre-setup, etc. Such a machine is worth
a lot to someone who doesn't want to bother - and the atari community is
FULL of people who don't want to bother.

If the day every comes that I sell my falcon - fully setup with CT60, I
can't imagine it'll go for less than $1000, that is unless people start
selling them.

$200 should get you a nice machine with hdd, 4megs, etc.

Remember too, the Amigas were arguably more popular. I don't know if
there's more of them out there or not, but I hear a lot of stories about
people trashing Atari ST's. There's simply not a ton of them around now.
Look on ebay... hardly ANY for sale. It wasn't that way just a couple
years ago.

Thanks,
Mark

I've had these nasty problems on Atari and it was all related to machine.
my 520ST and Mega ST were completely bugged. As soon as I got my Mega
STe, all these problems stopped with same disk and Link2. Then TT and
falcon are ROCK solid and never get even slight disk corruption despite
repeated improper shutdowns and crashes while I code ;)

Thanks,
Mark

> IMHO, the basic chipset does not stack up against a Falcon. I owned an
> A1200 as well - not as good a machine as the Falcon, again, IMO. :-)

yeah, but the a1200 is WAY easier to work with and expand. PCMCIA(solve my net connectivity for, well, essentially, free) builtin IDE, powerpc upgrades(kind of kills the reason why I'd buy it though...), FAR more common even in the US(apparently)....

Yes, if I had sufficient excess funds I'd be hunting TT/falcon/hades/etc. even(hah!) overseas ones, but I don't, hence the STe. I sort of know what a souped of falcon would be like via ARAnyM + xa-my-aes which is VERY nice.

Side note re ebay: I see that the guy that I was bidding against has been sucking up alot of Atari & Amiga stuff over the last several months, as well as some strange purchases of basic programming texts which aren't going to apply to either system even with their most "up-to-date" OSes. (Actually looks like he may even have let me win the STe auction, esp. considering he paid $255 for a basic Mega ST4, while he paid $71 for an accelerated one a few weeks ago?! "Dealer"? I've always investigated tenacious opponent bidders from my sniping(extemely numerous) losses... but thats ok as I *USUALLY* just do the max bid thing, and suffer the consequences... sigh...)

...and erm, if anyone has a spare, oh say, ICD Link97(or EtherNEC or both? or a copy of MAGIC or GENEVA(plus Neodesk 3+... have 2.02(and v1) myself already...) or so they want to sell for, er, well, a low price... }:)

Some day, I'll pay the hurt price and end up with a Falcon, preferably pre-pimped out...but I still want an Amiga a1200 as well, if for nothing else than the engineers who made the original Atari 8bit with all the extra support chips also designed the original Amigas, even if the OS looks (and acts) like something a band of wild chimps made...

You can't control the keyboard externally, effile connects to the MB KB
connector. I would assume effile works with any Atari which uses the same
KB.

PeST is a external solution for mouse only.

Chris

4158. 1040 ST/e available in Brisbane, Australia

I live in Brisbane, Australia and I haven't turned
my ST/e on for a few years now, so I guess
it's time to get rid of it.

I have an ST/e for anyone who wants to
come and pick it up.

It has 4MB of ram,
16MHz adspeed upgrade,
DTP Software
GCR
QIC150 tape drive and lots of tapes
300 Mb SCSI drive

It also has the original STiK source code,
though I guess that's changed a lot since
I last did any work on it ;)

Steve.

If your external monitor is VGA, it probably doesnt
have a speaker. VGA doesnt include the wires.

oops, forgot to add:

Something I was thinking of after I won the 1040STe(and looking at the Amigas), the seller should have broken it up into separate parts, i.e. hdd, 1040STe, Monitor, etc. He'd probably have gotten more total for the system that way.

(I learned all about this in the Apple2 groups. Apparently the base computer units are virtually worthless, but the RAM cards, drive cards, drives, etc. can be worth a significant amount of money if sold individually. Apparently my IIgs is worth about $15, but the cards, drives & manuals I have are probably worth $800 or so... I saw a dealer was selling the manual for one of my cards for $80!!! No card, just the manual! Also this manual is available online, although it took me a while to find it, and then the next day, I found my manual! :) Memory is fairly cheap for the GS though, although the only card still being made is only 4M but it is $49, drive controllers are like ST ones, ~$130 for new ones and the only one being made is just a compact flash "drive".)

Hello Mark.
Might give it Eiffel a look,I've seen someone selling them for ï¿½40 on
the internet, not a bad price really. The reason I'm slightly
reluctant to open up the case is that I once killed a perfectly good
ST when trying to add more memory - not the best person with circuit
boards and wires.

Might get PeST for my Falcon though as I only want to use a PC mouse
with that, the Falcon keyboard is just fine.

Cheers
Dave.

Eiffel would technically work in place of a Mega / Mega STE / TT
keyboard. The pins on the external keyboard ports are identical to
those inside of the STFMs.

Hence a TT keyboard working through this little port on an STFM;
http://www.retro.dial.pipex.com/stram/images/image4.jpg The TT keyboard
was one from eBay with it's plug cut off so I put a 4-way 3.5mm jack on
the end.

No reason why the Eiffel shouldn't work in this setup.

4165. Jaz drives

Newsgroup: comp.sys.atari.st

Hi all,

Whilst looking on Ebay for a SCSI 250mb zip drive for my TT I noticed that there are rather a lot of 1gb or 2gb Jaz drives for sale at fairly good prices.

The specs on Imogea.com look good in so far as the transfer rates etc but never having actually "seen one in the flesh" I wondered how they perform on Ataris.

What size partitions can HDDriver create on one disk? Is a Jaz drive simply just a really big zip drive?

Dave.

I have a SCSI ZIP and 2 SCSI JAZ drives.
All of them I found on a PC fleece marked.
Together 50 EUR.

They all work fine on my TT.

> What size partitions can HDDriver create on one disk? Is a Jaz drive
> simply just a really big zip drive?
>

It is not HDDriver that determines available partition sizes,
but OS (TOS, Magic or MINT) and the filesystem.

FAT32, ext2 or Minix: large enough.
TOS FAT: dependant of TOS version.

These maximums are mentioned on this platform many times
and I seem to be unable to remember them.

I have 1 JAZ medium for TOS 3.06 with 4 256Mb partitions that works.
The other media are 1 partition of 1Gb that I use with MiNT.

I only use the media for backup, not for heavy duty.

I am a lucky guy;
The day before my hard disc finally gave up I'd made a full backup
on the JAZ :-)

On my TOS 1.62 Atari STe, I'm using a 512Mb partition PC compatible (the maximum IIRC). Pretty useful to transfer datas.

> I only use the media for backup, not for heavy duty.

Be carfuel, Jaz cartidges are famous for having problems when aging. An, more specifically, the DRIVES are aging and can damage ALL your cartridges before you realise what happens. I've had this problem once... And now I'm backuping my Jaz cartridges ;)

Simon

You certainly are! According to Murphys' Law, its usually the day before
you were planning to make backups that the HD fails.

PS You know Murphys' Law - the one that states "anything that can go
wrong, will go wrong". It also has several subsets and sub-clauses that
covers everything the first part didn't. <grin>

Yes, I know.
Murphys law is a peoples explanation of entropy.

There is also the 'Peters principle' which states that in a company
everyone will carreer into a position where his capabilities and
competence become insufficient.

This principle is a peoples explanation of 'catastrophic collapse'
which is the scientific explanation for landslides and avalanches.

All young children learn the principle when they let dry sand
flow between their fingers on the beach.

4171. Falcon For Sale

Newsgroup: comp.sys.atari.st
Date: 2005-09-21 01:33:27 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>

Source record: 11148

Folks, I've gotten my first Falcon pretty well setup so I'm offering up my 2nd Falcon for sale. Its on Ebay. Its a 4 meg RAM, 1.4 gig HD comp. All keys, good shape, very clean. The only problem may be a questionable expansion port header. Let me explain. I sent it off to Mark Ducksworth for the motherboard mod and while he was doing this he had some problems with the header (random crashing). He did some work/repair to it and it seemed to be fixed. When I got the machine back, I re-attached the CT60 and the machine would work fine for about 20-30 mins then crash. I talked to Mark about it and he took a 2nd look at it. Right before this I had picked up a 2nd Falcon so I sent them both to him and had him switch everything out just in case. He took the MB mod off the 1st Falcon and set it back to its original state. The point is, that doing this 2nd period, Mark could not get it to crash or do anything like it did on me. Thats why I say questionable. I felt it was better if I told everyone about it though, before considering buying it.

Well, if that guy doesn't want it, I'd be interested in the computer itself, depending on what shipping is. Any rough ideas? I live in Prestonsburg, KY, 41653.

Thanks!

No idea, sorry.. but he definitely wants it!
I'll let you know if there's anything left over.

Steve.

I'll take that STiK source code! The abacus books would be cool too. Let
us know what he doesn't take. Don't toss anything (yet).

Thanks,
Mark

Just wanted to add a followup - Mark Ducksworth was nice enough to type up
some info on the Falcon I'm selling, the one that he looked at. Here it is:

Hello,

I didn't actually do any soldering work the second time around but just
pushed on the pins a bit. It seemed solid to me. Any oddities could
have been a product of humidity or celestial alignment or you name
it ;) The point is that this falcon is perfect with one possible
exception, if you install something on the upgrade header and things
behave oddly, you know where to look. If it gives you problems, there's
one single pin (but not sure which one specifically) which should be hit
with a soldering iron from the top (bad or pulled through-hole metal).

http://aoi.atari-source.com/~mduckworth/header.jpg - image is actually
ctlink from rodolphe's site, just pretend it's the motherboard ;) If
you know the falcon at all, you can tell which header we're speaking of
from the image.

But as I said, it should be fine, and if it gives you trouble, just
adjust the device plugged onto this header a tiny bit.

Thanks,
Mark

Thanks everyone.

Be aware that the computer would been a new power supply. 110V won't
get an STe expecting 240V very excited.

Steve,

This comment is pure nostalgia - when I was trying to get STiK working, based on Flinny's package, I was having a terrible time with MTUs and such settings, until I discovered that your example settings were for the ISP that I was using - NetInfo - now just a memory.

I promise not to TOS anything ;)

I'm pretty sure the latest sources are available
for download... Aren't they? It's been much
updated and improved since I stopped working
on it, so there's probably not much of interest
there unless you like historical bugs and limitations.

But, I'm happy to send it, if you're interested.
When I fire up the ST/e again to see if it still
works I'll copy it over to my PC.

Steve.

Hi David,

That's a very good point about the power supply. A good
reason for keeping it in Australia, perhaps ;) It's actually not
the original power supply anyway. Soon after getting the
ST/e I had it open and removed the metal cover from the
power supply while it was turned on and managed to
destroy it. The guy who fixed it only had an older
1040ST power supply, which has since had its
capacitors replaced. Maybe it'll be good for another
5 or 10 years ;)

The original STiK was thrown together in a very
short time in early 1995. In fact, the name meant
Steve's Internet Kludge. I'm not surprised you had
trouble with the settings. At the time I didn't know
what standard values were widely used, and added
config variables as I (thought I) needed them. But I
was really writing it for myself until I realised that
it would probably be useful for other people too.

> Susan and David Leaver 10 Goodparla St,
> Hawker, ACT 2614

I was living in Spence at the time. Were you in
Canberra in 1995? We could have formed a user
group! When I moved to Canberra in 1990 I stayed
a member of ACE in Sydney but didn't have much
luck contacting other Atari users in Canberra.

I owed money to Netinfo when I left Canberra,
and didn't pay them for about 6 or 8 months. I hope
I didn't contribute to their demise ;)

4181. Megafile 44 second Hard drive?

Newsgroup: comp.sys.atari.st
Date: 2005-09-21 05:49:50 UTC
From: atarionly <atarionly@adelphia.net>
Message-ID: <1127281790.952432.167990@g14g2000cwa.googlegroups.com>
Source record: 11058

I have a Atari Megafile 44 , it has the 2nd SCSI connector. Ive
connected a drive(Maxtor 7345SR) to the second connector and nothing.
Ive read every old message that I could find, checked web
sites(Vezz,Atariage and others). People look to have connected a drive
to the second connector and had no problems. I can connect the drive
by itself and see the maxtor no problem. I can connect the Syquest by
itself and no problem. I just cant get both of them to work together.

I have DIP switch 1-off 2-on 3-on
Ive tried the the Syquest on J2 and Maxtor on J3.
Syquest on J3 and maxtor on J2.
Both terminated, one on J2 terminated, one on J3 terminated.
Both IDs set at 0
Parity disabled on Maxtor

If anyone knows a site or just knows what I may be doing wrong please
let me know.

Vezzsweb site did have instructions saying it can be done but its not
clear(Italian). I looks to be more of rambling than anything,

Thanks,Don

It's a long time since I played with SCSI devices,
but...

Each SCSI device in a chain should have
a *different* ID

There should only be one terminator, at
the end of the chain.

Steve.

Hello,

As far as I remember, devices in the MF-44 must not be terminated, and
you should be able to see them : I once used this adapter in a recased
Mega-ST4, and both the Sysquest mechanic and a hard drive were running.

4186. different behaviour with different AES...

Newsgroup: comp.sys.atari.st
Date: 2005-09-21 18:28:59 UTC
From: Paolo <paolo@nospam.nospam>
Message-ID: <4331a5b1_2@x-privat.org>
Source record: 11063

Hi, Guys!
So I bought N_AES, and I thought it could the problem I had with MyAES with Papyrus (locking menubar).
Well, actuallly it did, but now I have a problem with Photoline (go figure!)
Photoline can't render ANY image, not even the images it loads as brushes or colourpalettes.
With any other set I tried (MyAES, XAaes, TOS) it works.
It works even by launching MyAES on top of N_AES!

Any help?

Thanks!

4187. Re: Megafile 44 second Hard drive?

Source record: 11064

I've no experience with the Megafile 44, but I do remember
adapting a few Megafile 20s, 30s and 60s to use two drives
(MFM or RLL, depending on size; LUN 0 and 1). Those were
the days!

A question about your MF 44: are J2 and J3 connectors on the same
cable? or two connection points on the host adapter?

If the latter, try to put the two drives on the SAME SCSI cable,
i.e., one after the other. SCSI IDs must *ALWAYS* be different
and the last one on the cable (furthest away from the host adapter)
should be terminated - but not always! (We called this SCSI voodoo!)

If the former, your SCSI cable might not be good. Try one drive
hooked up to J2; detect drive; turn off MF; unhook drive from J2
and hook it up to J3. Can you see the drive in both positions?

If still no joy, it's possible that Atari crippled the hardware
to allow only one SCSI device on the chain. I don't know whether
there is a utility to override this type of hardware setting.

Good luck!

Randy Kwak

I don't know what causes this on your machine but on my machine
Photoline 2.30 works just great with N_AES 2.0.0 and XaAES 0.995, both
with MiNT kernel 1.16.3.

Can you give more details?

Back in the 90's, I had 2 Megafiles, the 30 and 60 meg varities hooked up
at the same time. Worked just fine on a Mega ST.

I've currently got a Link 2 that supports a 4 gig SCSI HD, Plextor SCSI
CDRW, and a Syquest SCSI EZ135. No problems at all. All have unique IDs
and I have a termination block on the last connection in the chain. Again,
on a Mega ST.

centscreen
N_AES (+N_dialog)
Mint 1.16.3

If all of these SW are OK, I guess I am messing something in N_AES.cnf

By the way, I read about a patch for Photoline2.30 Is that true? What does it fix?

And by the way again, I have NO problems with the exact same setup but with MyAES, XaAES and TOS! I can even launch MyAES on the top of N-AES and have Photoline working!!!

Hi Don,

A>I have terminated the end and tried no temination. No change. I can
A>get the drives to seen but only one at a time. Never together. I have
A>eveen tried different IDs and no change.
what hard disk driver are you using? Some drivers need to `know'
whether an ID is used or not.

I mean some drivers offer to switch hooked drives on and off. An
off-switched drive will be 'known' to the driver but you will never
see its partitions on the desktop.

I suggest you terminate the adaptor itself and the second (last, LUN1)
unit, and unterminate (sorry!) the first unit (LUN0). And give a try
to IDCHECK or something like that (e.g. HDDRUTIL may do that job).

Some ten years ago (during my ST times), I sometimes hooked up to 6 or
7 drives to my 1040 ST, some ACSI adaptors with one or even two
logical units.

Pleas give us more information about your drive. Is it really an
original Megafile44 (by Atari). And of what type is your computer? For
STE Computers will not 'play' with a second ACSI device. Atari saved
some pennies by producing those adaptors...

Don't give up hope too early. I'm sure your problem is to be solved.
What happens if you hook the Maxtor the Syquest being switched off?

Und TTschï¿½

The Mf 44 is not the same as the 20 30 or 60. Those had other adapters in them.

J2 and J3 are 2 connection points on the scsi adapter.

Everything I have read about putting a second drive into the MF44 says to put them both on ID 0. I know the SCSI rules and from what I have read in old post this adapter does not conform to the rules. It was made buy Atari!!

Ive tried 3 scsi cables all work on my TT030. @ drives have been tried and they work on my TTs internal SCSI.

Only the drive on J2 is seen. Yes I have the dip switch on one turned off.

I don't remember the internal switch settings for handling 2 units, but
that makes only 8 possibilities, so it wouldn't take that much time to
find which applies, would it ?

Hi!

Let's try to clarify some points:

a> The Mf 44 is not the same as the 20 30 or 60. Those had other adapters
a> in them.

Right: Megafile 44 uses a SyQuest cartridge-drive, which is a SCSI unit,
while the non-changable Megafiles have an adapter ACSI-RLL.

a> Everything I have read about putting a second drive into the MF44 says
a> to put them both on ID 0.

And the drives must each be connected on its own (i.e. J2 and J3 must be
used).

a> Only the drive on J2 is seen. Yes I have the dip switch on one turned
a> off.

As far as I remember you have to modify the host adapter in order to use
it for two devices.

I think this *might* help you: <http://atari.nvg.org/scsihost/>. Although
the mod described there deals with a host adapter with only one SCSI plug,
there may be something valuable for you. Anyway it would be helpful to
know the part number of the host adapter (for web research...).

Regards,

Alexander

I found that site too. The dip switch settings for the mega STE and stacy look to be the same as the MF44. The part number is :C103310 Rev.2 = ST to SCSI Adaptor (PCB).

found another site with info on dips and the part number is the same as mine.

To me it looks ok. About n_aes.cnf I really don't know what could
possibly go wrong. I see no reason why n_aes.cnf would be the culprit.
Anyway feel free to send your n_aes.cnf to me.

AFAIK, the patch is only needed if you want to use Photoline 2.30
under MagicMac.

I really have no clue. Which version are you using? I use the TT030
version. On my Hades Photoline always has worked be it under N_AES or
XaAES. I don't know if it works under TOS as I haven't been using TOS
since 1995.

Ok, I think I sorted it...
Photoline works perfectly in 16 or True colours.
that meand that there is something wrong in the way Photoline exchanges
images data with N_AES when in 256 colour mode.
Unfortunately, my current video setup is 640x408@256 @80-ish Hz.
My TC setup is only 608x608 (yeah, weird) and I don't have enough space.
Strangely I can't have hi Hertz in 16 colour mode (it ranges in the 50) with
hi resolutions, and frankly I am not interested, either.

So, is there a way-out before Nature starts producing SuperVidel? ;-)

Uh,

I may be way off base here, but it's the DaynaPort SCSI Ethernet Adapter
and only specific kinds. And I have one of those specific kinds and never
got it to work. EtherNEC or better, CTlink is your best bet.

Thanks,
Mark

Well, not exactly :)

I think its not a DAYNA unfortunetly, Dayna should be easy to install since
we have drivers from ANODYNE.

My D-LINK is a DE-620CT.

CTLink is not ready, and ETHERNEC maybe is ok but something is wrong and it
wont work, and even its a not so good, cable for ROM EXPANDER, big ISA
card... I preffer little nice things :)

4209. Noise on TT and STE stereo outs.

Newsgroup: comp.sys.atari.st

Source record: 11086

Hello all.
Does any one know if there is any way to reduce the very high levels of noise on the stereo outs on both the TT and STE. Could a change of power supply help or perhaps extra shielding (probably unlikely) or is there no solution. Strangely the audio output from the STEs monitor jack seems quieter but
obviously in mono.

Thanks in advance.

Hello All,

Just wanted to tell everyone that I have successfully installed Debian Sarge on my Hades060 using the CD-Rom method. Right now I do not have graphics, I just have the consoles. I am trying to reconfigure the Xserver so as to bring up the Gnome desktop. I also want to compile a new and updated kernel which is something I have not done before, so it may take awhile. My network PCI card is not recognized which is the biggest reason I want a new kernel.

Message-ID: <pan.2005.09.23.18.53.51.490956@nowhere.com>
Source record: 11089

I'm not having much luck tracking down this error code, but
a harddrive in an ICD FA-ST drive enclosure is returning:
error: sense $04

Does anyone have any ideas what this is?
(ICD utils report it as an Adaptec 5500. I haven't had a chance to crack
open the drive case and check out the mechanism yet though...)

4215. Cleaning STs...

Newsgroup: comp.sys.atari.st
Date: 2005-09-23 19:00:37 UTC
From: cutterjohn <someone@nowhere.com>
Message-ID: <pan.2005.09.23.19.00.35.952367@nowhere.com>
Source record: 11090

What do people use to clean St cases?

Would isopropyl alcohol 50% abv be ok, or would it a) attack the plastics or b) should I purchase a higher alcohol content?

I'm also in need of some advice re: cleaning corrosion on cartidge port spring "pins". The pins look ok, it's just that there is corrosion that is definitely going to have to be cleaned off before any cartride would work.

V key is not registering. Any common problems with keyboards other than to try to clean it, hope for the best, then replace keyboard failing that?

I also need to crack open the STe case and check out the internal conditions...

(Yes, this is that STe that I bid on (and won!! }:) on ebay last week. It was in about the shape that I figure, it DOES work has 4M and TOS 2.06(apparently, although the seller listed it as 2.05 Teradesk says 2.06.)

The floppy drives on the STe are QUIET. My hopes were somewhat dashed when I looked at the STe language disk and it mentioned copyright omikron and I thought that I had gotten omikron basic. No such luck just plain old junky ST BASIC, although I think a newer version than what came with my 520ST although I don't think that it's any better from what I've read. (And I'm not really interested in BASIC anyways, but...)

I was reading an article on, myatari(or one of the other online mags that is still kicking) about a guy who had a Mega STe2. He mentioned that he always had problems with sound and finally found out c. 2000 about replacing one of the socketed chips with an older version that cleared up his sound problems in the Mega. IIRC the article was written c. 2002, and it should be readily apparent. (The guy was Chinese, but I've forgotten his name...ah Shiuming Lai... looking for the article...)

found it:
http://www.myatari.net/issues/sep2002/megaste.htm

I think its towards the end of the article. Actually it was on the third page, and here's the relevant quote:
"2000: Goodbye Snap, Crackle and Pop

This naughty chip on the right was mercilessly extracted from its cosy PLCC socket in February. While at university I'd gathered from some obscure Usenet postings that it could be the culprit behind my wobbly graphics and crackling sound. The solution was allegedly the older video shifter, part C300588. I tracked one down, popped it in and instantly cured the seven-and-a-half year bane of my STE enjoyment. No more envying 520 and 1040STE owners, I could have my cake and eat it. Of all the Mega STEs I've ever looked inside there was the C300588, it was just like me to get the lemon, no wonder nobody seemed to have a clue what I was talking about when I described the problems it caused."(Mega STE Love by Shiuming Lai)

HTH as in you problem wasn't just noise...

Hi,
I found a list of sense codes. These were in the
documentation for some SCSI Tape drive access
code called TapeBIOS by a guy named Alan Hourihane.

His code was for accessing Tape devices, but
most sense codes should generally mean the same
thing on different devices.

Steve.

Sense Key (0-7) Descriptions

==========
Sense Key Description
--- ---
0H NO SENSE. Indicates that there is no specific Sense
Key information to be reported. This would be the
case for a successful command or a command checked
because of Filemark, EOM or ILI bits being set to
one.

1H RECOVERED ERROR. Indicates that the last command
completed successfully with some recovery action
performed by the target.

2H NOT READY. Indicates that the Tape Drive addressed
cannot be accessed. Operator intervention may be
required to correct this condition.

3H MEDIUM ERROR. Indicates that the target detected a
non-recovered error condition which was probably
caused by a flaw in the medium or an error in the
recorded data.

4H HARDWARE ERROR. Indicates that the target detected a non-recoverable hardware failure (for example, controller failure, device failure, parity error, etc.) while performing the commandor during a self test.

5H ILLEGAL REQUEST. Indicates that there was an Illegal parameter in the Command Descriptor Block or in the additional parameters supplied as data for some commands (Set Mode, etc.).

6H UNIT ATTENTION. Indicates that the Tape Drive may have been taken off line or the TAPE CONTROLLER reset (by BUS DEVICE RESET message or "Hard" Reset Condition or by CLEAR DRIVE command) since the last command was issued to the Logical Unit. This Sense Key is reported the first time that any command is issued after the condition is detected and the requested command is not performed. The UNIT ATTENTION Sense Key is reported to all Initiators which subsequently issue a command to the TAPE CONTROLLER. This Sense Key is cleared for the next command from the same initiator.

7H DATA PROTECT. Indicates that a command which writes to the tape was prevented by the absense of a write enable ring. The write operation is not performed.

8H BLANK CHECK. Indicates that a read operation timed out without finding data.

9H VENDOR UNIQUE. Provided by SCSI to report vendor unique conditions.

AH COPY ABORTED. Generally not used.

BH ABORTED COMMAND. Indicates that the target aborted the command. The initiator may be able to recover by trying the command again.

CH EQUAL. not used.

DH VOLUME OVERFLOW. Indicates that the tape drive has reached the End of Tape and data remains in the buffer which has not been written to the tape. A Recover Buffered Data command may be issued to read the unwritten data from the buffer. (set only when PEOT is set in MODE SELECT command)

EH MISCOMPARE. not used.

FH This Sense Key is RESERVED.

Thanks for the response. I was afraid that, that was one of the more serious error codes, still I'll have to open up the enclosure and check out the connections. The other drive seems to be running well for now though, although looking at the partition names from the "dead" drive I'll probably miss some of that stuff...

(Now to find some high-density D connector to the generic 50 pin converter as, unfortunately all of my unused SCSI drives have those(high density)... grr... and/or are SCSI-2/3 or ultra... sigh... and of course my other(pretty new) external enclosure only has the old(!!) 50 pin connector as well...)

4222. Aniplayer help?

Newsgroup: comp.sys.atari.st
Date: 2005-09-23 22:45:28 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.09.23.22.45.28.303670@charter.net>
Source record: 11097

Okay, I've got my CT60'ed Falcon back together and running again.

But...(why does there always have to be a "but"?)...I can't seem to get Aniplayer working right.

I grabbed v2.22 from Didiers' web site, extracted it, ran the setup app, it picked C for everything so I just let it have its way. It stuck a couple of programs in the AUTO folder and some other stuff in the root of C. I copied the English stuff over so I could read it, etc, etc,...

Tried to play an OGG. Pallette on the desktop background lose most of its color and the mouse pointer freezes. Everything freezes, requiring a hard powerdown (manual switch off) and rebooting. Its much faster going through the fsck check with my CT60 but thats not really why I got it. :-)

Same with an MPEG.

Ditto with an AVI.

Ditto with a MOV.

Can anyone point me to a install guide or perhaps tell me what I'm doing wrong? I ran Aniplayer with my old Nemesis Falcon years ago and I never had any trouble. Very solid program, so I'm assuming its me.

Thanks everyone.

After finding out, quite accidentally, that baby wipes[0] are good for cleaning all sorts of things, I use them for cleaning keyboards and the like. You will, of course, need to make sure either you've removed the motherboard from the case or disconnect it from the power before giving it a clean.

>I'm also in need of some advice re: cleaning corrosion on cartidge port

No idea. Never had this problem.

>V key is not registering. Any common problems with keyboards other than
>to try to clean it, hope for the best, then replace keyboard failing that?

Other than the problems with the very stupid position of the mouse/joystick ports making them prone to failure if you don't use joystick extenders? As luck would have it, that's easily solved with a touch from a soldering iron.

As for the failure of the 'V' key, that's probably because a small amount of dirt has found its way in between the contact of the rubber cup and the traces on the keyboard PCB. Just strip the keyboard down and removed any debris that's on either the cups or the board.

You'll find you need to remove somewhere in the region of 20 small screws to undo and watch for cups stuck to the PCB when you separate the board from the plastic top. Also, note that there's one less cup than places for them, the missing cup being the upper one of the return key.

Re-assembly of the keyboard is easier if you place the edges of the top on a couple of books, or similar, so the keys are not resting on any surface. That way the rubber cups stay in place and it makes it a little easier to place the PCB back in place and screw it back together.

BTW, when you do strip the keyboard, it's a good idea to retouch the mouse/joystick connectors even if they haven't failed. Apart from anything else, it means that if they were going to fail, you'll have prevented it for a while longer.

[0] The fragrance-free varieties are the ones I prefer. I don't really
want my keyboards smelling like a freshly cleaned baby.

Regards,
David Bolt

Thanks for the tip, and I'll be careful with [0] as I can't stand the
smell myself. (Heh don't clean while powered on! I'd bet that would be an
electrifying experience! };)

<lots of stuff about keyboard/ports assembly/cleaning etc and sig snipped>

Thanks for the tips. What I expect that I probably will end up doing is
taking it apart, and while apart for keyboard cleaning, wipe down the
empty plastic shell.

So, how are those Acorns? I looked into buying a recent model from Castle
IIRC several years ago, but they were somewhat expensive, and I doubted
that there'd be all that much interesting for them. Not to mention if
they didn't use a "universal" power supply I'd end having to replace it,
but IIRC they were just plain old ATX PS. (Ended up paying attent more to
the Eyetech stuff and possible new Amigas, but not much was happening at
the time then the first one seemed to have all sorts of, essentially,
fatal hw problems... Not to mention why bother buying a new one just to
have to emulate the old machines and NOT having a GCR floppy... sigh...)

thanks
john

D-U-D-E!!!! STOP RIGHT THERE!!!!!! DO NOT USE ALCHOL!!!
last time me and alchol got around arcrylic or plastic it shattered..
i own four atari type computers and have maintained them with a mild
mixture of common cleaners........take a shot glass put in a half cap full
of bleach ,with a drop or two of dish soap ,fill the remainder up with hot
water.....now the procedure, get an old tooth brush and some paper towel
dunk the tooth brush and let drips back in container not too wet !!!!
now paint the area to be cleaned even scrubbing if need so , then wipe down
with paper towel. works great for me.

ok ,pay me later.
charles ,ha ha ha ha ha!!

To tell you the truth, they rarely get much use. The same goes for the Falcon and STE. Occasionally I'll hook them all up and check they still work, sometimes play with some of the software installed[0] and then power them down again. Unfortunately only the RPC has somewhere close to a permanent location, but is usually untouched. The A3010, A4000 and both Atari machines are presently stored out of the way.

>Not to mention if
>they didn't use a "universal" power supply I'd end having to replace it,
>but IIRC they were just plain old ATX PS.

Not sure just what sort of power supply they use but, from the last time I looked inside the RPC[1] I'd guess they're more like an AT type rather than an ATX. AFAIK they're fixed voltage as well, which would mean either sourcing a 120V PSU or getting an inverter so you could run them at 240V.

>(Ended up paying attent more to
>the Eyetech stuff and possible new Amigas, but not much was happening at
>the time then the first one seemed to have all sorts of, essentially,
>fatal hw problems... Not to mention why bother buying a new one just to
>have to emulate the old machines and NOT having a GCR floppy... sigh...)

Can honestly say that, even though I've been offered a few Amigas (A500, A600 and an A1200) they've just held no interest for me. I actually used the 1200 for a while before deciding that they wouldn't be worth it to me. They'd probably end up with less use that the machines I already have.

[0] Acorn Elite is one cracker of a game. Much better than any of the over versions I've seen, and a little harder in some respects[2][3]. Plus you can get the furry dice addition[4] :)

[1] about 5 minutes after it arrived as I was swapping out the two 4MB SIMMS for a couple of 64MB SIMMS, checking the processors to see what speed the 486 was and if it was equipped with a Strong ARM. No such luck, it only has an ARM 6 processor. Good enough, but a Strong ARM would have been nice.

[2] roaming bands of police vipers patrol the systems. In the more
civilised systems they will attack you if you're an offender or
fugitive, which can be a bit of a pain. Other times they come in handy
as they sometimes come to your aid when you're attacked by pirates.

[3] if you don't have a docking computer you can dock manually or, if
you can afford it, pay for the stations computer to do all the docking
control instead.

[4] They hang off a rear view mirror and, for real novelty value, they
even swing when you change directions.

Regards,
David Bolt

Dude, there must be something fishy with your system.
The only troubly I've had with Aniplayer is some slight hickups in
Xaaes, but nothing that hangs the computer..

regards

Well, Mpeg and OGG... maybe you need to check for the correct location of the SLB files. By the way, I can't get OGG vork with the 030 library, I need to use the 68000 one :-/

Well, I'm using Naes 2.0, if that makes a difference. It shouldn't, I would imagine.

I did have the slb files in the wrong place. I copied them into the Aniplay folder but is that the right place?

What settings are you using, if you don't mind my asking?

Thanks!

Well, where exactly is the correct location? The setup app installed them
to C, so I moved them back into the Aniplay folder but is that the right
place?

I don't even know which library I'm using. :-(

You can have your SLB files in your Aniplayer directory, or in another
directory like C:\SLB\ or wherever. Then you have to define an environment
variable SLBPATH=C:\SLB in mint.cnf, xaaes.cnf or n_aes.cnf so that
Aniplayer can find them.

Thanks Martin.

Well, I've made *some* progress. With the *.SLB files in the Aniplay
folder, and d2d off, I can start a MOV, AVI, or MPG movie. It starts, then
it always says the sound system is already in use, then I get an
"Aniplayer has performed an illegal instruction" error.

Am I supposed to be copying any of the '060 files? How about memory? Am I
supposed to set Aniplayer to fast RAM only or vice versa?

Thanks everyone.

Okay, now its weird. Just for the fun of it, I put Aniplayer v2.07 back on.

Ran it - it runs the AVI videos I've got okay. Sound is a little fuzzy,
but that may be the file itself. No crashes.

So what the diff in 2.22 and 2.07 besides the obvious improvements? Anyone
have any idea why the older version will run and the older version won't?

Thanks gang.

Just wondering, after reading some of the docs, do you have to have SDL setup under MINT to be able to run PMDOOM? I'm not able to get the latest release (.45) to work with the 4 meg shareware wad (its the only one I have). It errors out with some complaint about not being able to use some texture (blue something?).

Thanks everyone.

Check your SDMA clock or your F030 system clock.

Thanks for the reply Didier.

Well, it turned out I needed to copy all the *.SLB files back into the
Aniplayer folder itself. That stopped it from freezing up. Now it just
crashes. Odd thing is, v2.07 (shareware) plays okay without crashing.

Your WAD file is too old (1.2 version or older). Grab latest 1.9 shareware
version there: http://www.liberatedgames.org/game.php?game_id=9

No, juste rename your Doom.wad as Doom1.wad, and it will work fine.
I found it reading the doom faq on the web.

Hi,
Thanks to all who responded.

If 512mb is the largest partition size I can have under TT TOS then
that's fine, bigger than a ZIP drive anyway. Speaking of ZIP drives
are there any benefits to using these instead of a Jaz (apart from the
size)? Someone mentioned that they (jaz) are carts not disks? What's
the difference? As I mentioned before, I've never seen a Jaz drive
"in the flesh".

A MiNT installation is in the not too distant future... after I have
something to backup the current setp :o)

Cheers for now.

Dave.

Hi there, again!

Any ways I did a chimp open up and check on the FA-ST drive. The
enclosure has no water damage inside, but it was a little dusty, so I did
a quick de-dusting. (I'll do a more complete job soon when I complete
take the enclosure apart to clean the outside, and get to the fan outlet
to clean that completely.)

I didn't bother to disconnect and reconnect the cables at this time, but I
did push them into both drives to see if maybe one of the cables was
loose. They both seemed to be in pretty well. (When I disassemble it, I
will of course be disconnecting both drives from everything...)

Anyways it turned out that both drive are Quantum LPSes although one says
lightning on it. I think that it's a Quantum lightning lps365 IIRC. The
other drive just says quantum lps and lists cylinder/heads/sectors for 3
different types of drive. I didn't really see anything on either drive to
identify what size it was or that it was even SCSI for that matter.
(Sheesh!)

Now, after doing that I think that I can hear the other drive trying to
spin up, but it never makes it. As a matter of fact today it was doing
that but seemed to lock the bus.

The LED for what I am guessing is supposed to be the 2nd drive would come
on then never go off. The working drive would flicker on then off first,
but when it was trying to boot, I'd get the first drive then hear, what I
believe to be the second drive(should've left the cover loose!) the light
never would go out, then I would get a sense error $FE {0,0} in the upper
right hand corner. The desktop would show a C: drive but say that it
wasn't available when access was attempted. Now the odd thing, a
ctrl-alt-del will generally get me booted up with the working drive. (I
still think that I can hear the second drive try for a while, then give up...)

...will work on that after cleaning up the rest, as at least worst case one drive works, the ICD adapter works, and I can get an adapter for one of my 2(or so)G drive for ~$15. (Still I'd like to get that software off of there... I wonder what happened to the original disks, and manuals as I'd guess it was all legit. }:)

> D-U-D-E!!!! STOP RIGHT THERE!!!!!! DO NOT USE ALCHOL!!!

Hi again!

Ok, took down the case today with the original intent to do the full job. (Does anyone else think that Atari could, maybe, have fit in another 1000 screws or so somewhere? ;)

Anyways, got the plastic case top off. Disconnected the keyboard(is the keyboard cable supposed to be that easy to pull out?) Brushed off the keyboard with a dry toothbrush(just used a new one as I have a few extras ATM). Put that aside and decided to work on getting the shielding(RF mainly I presume) off.

Now I had a look at the internal damage. I would hazard, maybe that one or both MIDI ports are probably shot. the one closest to the back looks in pretty bad shape internally, while the other doesn't look all that bad. Now for the surprising part. Once I got the shielding off of the power supply and off the rest of the shielding, it looks like that was the ONLY part to have been affected by the water. Looked like the metal shielding worked for more than RF shielding.

At this point I ran into a REAL problem. the lower left(towards front, other side from mouse ports) the plastic post with the metal receptacle for the screw there is BROKEN off from the bottom plasic case. I tried to hold it in place with with a flat bladed screw driver, but that didn't work. I don't think that I have any needle nose pliers(couldn't find one) so that is out. My other idea for getting this was to clip the shield there in the corner so that I could get it off, then get the logic board out.

Anyone else have any better ideas regarding dealing with the broken posted screw?

(Yep, sure enough there were 4 1M SIMMs as expected, and the ROM chips were labeled MYF(IIRC) 2.06. Wasn't sure about the rest, and just intended to close back up until I had a way to get the logic board out.)

Did more quick dusting and debris removal(not much). Screwed everything back down and did a test powerup. (see other message regarding hard drive. Was going to do more, but it started raining, and I was tired of playing around with 10,000,000 screws holding everything together. Atari probably could have saved a couple more bucks by dropping about half of those screws! I figure that there are at least 26 screws on the keyboard to separate the logic board from the rest of the keyboard! nuts!) And, of

course, the V key still did not work, but that'll have to wait for more time and better weather, as I plan to wash the plastics outside and let them dry out there, hopefully, in the sunlight... (Tuesday evening maybe...)

Oh yes, the floppy was an EPSON, but I didn't bother with the part # as I'd hazard that they are no longer available, but I'd like to know which FDC chip I have. (Was thinking of trying a 1.44M drive once everything is cleaned out.)

thanks
john

I've read that you can bung stuck drives into the freezer for a couple
of hours, frees up stuck mechs long enough to suck the contents off.

Might be worth a drop or two of thin oil on the drive bearing if you
can see it.

Hi Pawel!

PK>It should be possible to connect the D-Link DE 600 pocket adaptor to
PK>the parallel port of a Falcon, because this one is bidirectional.

All STs have bidirectional parallel ports. But the Falcon has got =
more of the handshake lines than older models had. These are ACKNLG =
and SLCT. Computers mostly have 25-pin connectors, as opposed to =
printers having 36-pin connectors. Therefore, the pin numbers are in =
some cases different.

PK>So anybody who already try to use it with Falcon like that?

I don't know if (even on the Falcon) all necessary lines are =
available. And even if so: I don't know of any driver for this =
combination.

I've got a Genius Ethernet adaptor hooked up to my Falcon using a rom-=
port interface from Elmar Hilgart.

With best regards
Ekkehard

P.S.: some information from Chips'n Chips by Michael Ruge, translation =
and additions by Ekkehard Flessa.

The Centronics interface, sometimes called parallel port,
transmits data on 8 parallel signal lines (plus some additional
handshake lines).

data transfer type: 8 Bit parallel
transfer rate: max. 1000 cps (???)
synchronisation: STROBE-Signal from computer
handshake: by ACKNLG- or BUSY-signal
signal voltage: TTL-compatible (0V/5V)
cable connector: 57-30360 from Amphenol
connector on printer side: 57-40360 from Amphenol

Pinout of the connectors (Delta-Ribbon type) und description
of the signals:

S: Atari ST (according to german 520ST users manual)
F: Falcon (according to german Falcon users manual)

SF Pin-Nr. signal name input or description
output on
printer side

xx 1 STROBE in The STROBE-impulse triggers read-
in of the data.
xx 2-9 Data 1-8 in Incoming data are equal to bits
1-8 of a data byte that is sent
to the printer.
-x 10 ACKNLG out After reception of a data word,
this signal goes to 0V for
approx. 10 Microseconds.
The printer tells the computer
that the data have arrived and
it is ready for the next word.
xx 11 BUSY out Set to 0V to indicate that the
pronter is ready to receive data.
In case there's no paper or the
printer is OFF-LINE, this line
carries 5V.
-- 12 PE out Carries 5V in case of paper empty.
-x 13 SLCT out Indicates whether the printer is
in use. Falcon connector: Pin 17
-- 14 AUTO FEED XT in If set to 0V, the printer will
always append a line feed.
-- 16 GND out logic ground.
-- 17 CHASSIS-GND out ground from printer chassis.
xx 19-30 GND out ground for printer cable.
-- 31 INIT in Reset line for printer. If set to
0V, the printer RAM will be
erased.
-- 32 ERROR out Will be 0V in case of paper empty
or OFFLINE. N/C on Atari side.
-- 33 GND out ground for printer cable.
-- 35 out High level (+5V) via a resistor
from printer's power supply.
-- 36 SLCT IN in Must be 0V to allow data reception
for the printer. Set to 0V in the
printer cable if other side is
25-pin.

Pins 15, 18 and 34 are N/C.

4252. Atari 1040ST screen flicker when loading from disk

I just got a 1040 that when loading from disk the screen flickers, flips for 1 second on every track read. Other than that everything else seems to be working ok. Any ideas? It seems after it warms up the flicker goes away! Hmmm....

You're better off asking at Atari Forum (www.atari-forum.com) as there's
more than a few enlightened game players on the site you can ask these
questions.

Umm, I made a feeble attempt to answer this at Atari Age, but basically
what I said was try the time-honored tradition of raising it a couple of
inches in the air and dropping it on a hard surface. If it works, then
you'll eventually need to open it up and reseat all the socketed chips.

If it doesn't work, my best bet (and first guess actually) would be that
your power supply is weak and you need a new one.

HTHs.

Thanks for the reply.

Well, I renamed it to "DOOM1.WAD" and the game doesn't complain about the
texture anymore. It just crashes hard. :-(

Thanks for the reply.

Well, I downloaded that file. Copied the DOOM2.WAD file over so I have the
following in the PMDOOM folder now:

DOOM.WAD
DOOM1.WAD
DOOM2.WAD

Running the game as "DOOM.PRG" or "DOOM.TTP" and passing it the WAD file
to use as parameters results in an error and crash. The error from
MINTSETT looks like this:

! pid 63 (doom): ILLEGAL
INSTRUCTION: User PC=10DBA2a
(basepage=1674000,
text=1674100, data=16ECF90,
bss=170BB30)

and it locks MINT up hard, requiring a manual reset or powerdown.

Now...I can use the "-audio off" option and it runs just fine. With no
sound. Which is not nearly as fun. :-)

I've got a Falcon 030 with the CT60 accelerator, running at 90mhz, with a
Wizztronics 14 meg ST RAM card, and a 256 meg SDRAM stick by Crucial in
the CT60. I've also got the motherboard mod.

Anyone have any ideas why trying to use sound causes the system to lockup
hard?

Thanks.

Didier, I'm a complete newbie when it comes to the CT60 'n stuff. I've no idea how to do what you just said. If you could please tell me how?

BTW, I went back, turned sound off, and it plays the movies fine. Its something thats going on whenever sound is accessed/used. I don't know if that helps point in the right direction or not.

Thanks.

Your PSU is dying. The flickering is caused by a drop in voltage everytime
the floppy-drive move it's head.

I had the same problem with my brand-new 10040 in 1987. If it is caused
by poor regulation of the power supply, it might be fixed by additional
electrolytic capacitor between the +12V and GND lines. Another cause
might be larger voltage drops caused by high currents flowing through
the GND line. This might be fixed by providing a better, lower-restance
connection between PSU and disk drive GND pins.

Christian

It is wiser to replace failing electrolytics.

If their capacitance is decreasing, they are drying out and will eventually
fail, possibly in a dangerous way (smoke, fire, shorting).

Have you stuck a meter on the rails around the board?

If it is dipping significantly, you know the power rail is to blame.

I cant think of anything else that connects video with floppy disc...

4264. d-link pocket ethernet

Newsgroup: comp.sys.atari.st
Date: 2005-09-27 12:47:14 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <dhbf0i$6qf$1@reader1.panix.com>
Source record: 10991

At one time, the only ethernet opition for an ST was the DL 600
ethernet adaptor. It needed a small circuit built, and probably
connected to the cartridge port.

The file with all the information needed in it starts with the
characters TUW, and may be found in the umich archive, when last
I looked, and on one of the Ausgabe CDs. It comes with drivers
for MiNT, which at the time was probably the quite compact
KGMD.

I would also think that the Technical University of Whatever
would have a copy.

If you have a D-Link, do not give up yet. You may need to
learn German, or to make a GAL, but those things are possible.

Jim

Yes. I remember reading something about that years ago as well. I also seem to think that I recall leaving a drive out in the sun.

I'm not really sure that I believe either one though. I'll have to check around some before trying it, but I guess in a worst case situation it'd be better than nothing, but I'll wait until I get my adapter and setup one of the 2G drive as another external in case it does work and copy all of the stuff to the "new" drive...

It's possible on some drives to see an exposed drive bearing? (I've never heard of this at all...)

(At this point I'm possibly more inclined to believe that maybe the drive doesn't have a good connection as in the cables need to be reseated, or maybe that section of the cable is bad, but with SCSI I'd expect the whole drive chain not to work if that was the case. Anyways this evening I'll be working on it some more...)

I've used an old house brush before to dust them down. If that isn't enough I take the things apart so that you have just the outer case with nothing attached. You can give that a good wash with a bit of soapy water. It generally insn't recommended to use detergent, but I've never had a problem. I give the case a rinse and let it dry or use a hair drier to help.

If you fancy cleaning some stubborn marks try lighter fluid. This should remove quite a number of things without damaging the plastic.

Isopropyl may be OK but I've not found it very effective. It's OK for removing minor marks but it can dry the plastic and you'd need quite a lot of it to do an ST case.

> I'm also in need of some advice re: cleaning corrosion on cartidge port
> spring "pins". The pins look ok, it's just that there is corrosion that
> is definitely going to have to be cleaned off before any cartride would
> work.

You want to use something that isn't going course further damage. Very fine wire wool would work but if you have bits of it left in there you could damage the ST. I'd use some fine carborundum paper (400 or 600) . You can stick a bit to a lolly stick or stiff bit of card so you can get it inside. Don't overdo it ! You'll need to clean out the dust with a brush and you could give it a wipe to pick up any remaining bits.

> V key is not registering. Any common problems with keyboards other than
> to try to clean it, hope for the best, then replace keyboard failing that?

Could be a bit of muck got in. St keyboards are a bit fiddly to take apart and more difficult to assemble due to the little rubber caps that bounce off. If you can get another keyboard it could save a lot of hassle to just swap it.

> I also need to crack open the STe case and check out the internal

Bleach ? Why risk using bleach ? It isn't necessary. It is something that could damage the plastic so best avoided. Just the soapy water should do the job fine.

Ronald,

You should really check your CT60 installation. I think there are some test utilities for SCSI and SDMA in the CT2/CT60 archives. Also, I suggest you try some different SDRAM modules and some different PSUs.

Hi Peter. Thanks for the reply.

Does the fact that PMDOOM will play fine with the "-audio off" switch give
any indication as to where to start?

I *should* have good hardware. I've got a new PSU, I'm using Crucial RAM
in the CT60 and the Wizztronics 14 meg RAM card on the ST RAM side. I'm
not getting any odd pixels or video garbage. No random crashes. The CPU
is staying about 31 deg C. Its just the sound. Not all sound at that. I
can use Bobtracker, which uses the DSP to play MODs just fine, clear and
crisp.

Thanks.

It depends one what has stuck. On many "stuck drives" the heads have not
retracted properly or the head retaining latch has jammed. In the these
cases the data can some times be recovered by removing the top cover,
freeing the head arm, and the reading the data off. I have done this on a
coup,e of IDE drives on PC's

Dave.

Ronald,

Do you have something modifying your sound matrix? Poke around with
the sound .CPX (I can't recall if that is actually it's name) and see
what you come up with.

Galen

Thanks. Took the top off again today and the keyboard out. Decided to
go with a diluted solution of bleach and warm water, as I was worried
about the origins of the water involved in the damage, plus whatever else
had been done to it. So I got my trusty tooth brush a plastic cup, the
upper half of the plastic case, scrubbed in inside and out, and let it
dry. After this I grabbed the keyboard, took off the circuit board,
put all the rubber cups to the side, then took the keyboard outside and
applied the same treatment as the case. I let them dry for ~3hours
outside, mostly in the sun, but it gets darker earlier now. They were
mostly dry(case completely), and the keyboard as far as I could tell was
dry, so I put the cups back on the keyboard(good tip re: the books as
props) put the circuit board back out, connected keyboard, then put top
half of case back on again.

Tested it out just now, and all the printable(or obvious modifier keys
and tab/delete/etc) all work. The rest I am assuming work(e.g. function
keys) as they give a speak pseudo-click sound when depressed. I'm
pretty happy with the case cleaning job as it looks almost as good as new
although not in quite the same condition as my 520.

I noticed it was pretty cheap when I took the circuit board off.
Wonderful people those Tramiels, but I guess they really meant RBP!

>> I also need to crack open the STe case and check out the internal
>> conditions...
>
> Why ? If it works OK leave it alone !
>
I was/am concerned about how far the water damage spread. Looks not too bad, but I now need to work out a way to free that one last screw to get the main shield off, then the logic board out. I want to do the same cleaning to the bottom half of the case, and do dust/debris removal as necessary on the logic board. Additionally, it'd probably make the corrosion cleaning easier, esp. if I could get a ckt brd vice to put the logic board in while working on it...

New electrolytics have the advantage that they offer more capacitance as
electrolytics manufactured ten or twenty years ago.

Christian

Ah, well, I just get that impression since your MiNT installation screws up and some other stuff (Aniplayer, PmDOOM) doesn't work properly.

PmDoom has sound problems on my machine too; in MiNT I can only use the 8-bit SDMA driver, and the sound is heavily distorted. Other stuff work fine though.

Have you boosted the mainboard?
Are you sure the SDMA clock is ok?

Some problems with the system may only appear when using certain applications..

Yep coming soon. I just want to get X11 up and also the Gnome desktop. I tried something to get it working and wiped out something and Linux does not boot. I am installing it again now. Going smoothly like before.

Wht problems did you encounter when you tried to install Debian 2.1?

> PmDoom has sound problems on my machine too; in MiNT I can only use the
> 8-bit SDMA driver, and the sound is heavily distorted. Other stuff work
> fine though.

Like most people, nobody read the README.SDL file that is present, that gives many infos about what SDL drivers are available depending on the OS and hardware you run it on, and where you can find this about audio drivers:

```
Audio O/S Misc
dma8 All Uses MFP Timer A interrupt
xbios TOS Uses MFP Timer A interrupt
xbios MiNT Uses MiNT thread
xbios Magic Disabled
stfa All Uses MFP interrupt
mcsn TOS Uses MFP Timer A interrupt
mcsn MiNT Uses MiNT thread
mcsn Magic Disabled
gsxb All Uses GSXB callback
```

A standard falcon should have some problems trying to replay audio under Doom (8 mixed channels, 16 bits stereo sound) at least till a DSP driver is implemented. But it should be OK on CT60, provided that FastRam and caches are enabled.

About Magic: nobody volunteers to test audio under it before I release SDL 1.2.9, so I prefered to disable audio to be on safe side.

Well...I'm sorry that wasn't the correct solution. Although in the past
when I've had that happen, that was the cause. Any chance, (and I know its
a long one) that you've got *2* bad power supplies?

Yes, I had Mark Ducksworth do it for me.

> Are you sure the SDMA clock is ok?

No idea. How do I go about checking it?

> Some problems with the system may only appear when using certain
> applications..

Right - and I can assume that it usually stems from a single problem, yes?

So right now - sound with DOOM = crash
sound with Aniplayer = crash

sound with Bobtracker - no problems

Not tried much else. Can you recommend some software to test that might
help narrow the problem down? Or some testing software?

Thank you very much! :-)

Well, try again without the boot.

> > Are you sure the SDMA clock is ok?
>
> No idea. How do I go about checking it?

Like I said before it's an hardware problem... SDMA clock is bad.
Your answer is here:
http://www.czuba-tech.com/CT60/english/Fitt_sold.htm
Some important part :

"Verify you see no 74F08 soldered (added) on the clock trace near the SDMA chip. If yes, you must remove this 74F08 and connect again the clock trace (that was cutted for this 74F08).
- If you see a component 74F08 or 74F04 on the GAL U63 (left of the NVRAM) with some wires connected on the resistor places R216, R217, R221 & R222, you must remove this component and the wires. Solder the three 33 ohms SMT resistors (furnished) on R216, R221 & R222 places.
- If you have no 74F08 or 04 on U63, you have to verify all the three resistors R216, R221 & R222 are well 33 ohms marked 330 or 33R). On some motherboards, one of them can be a 0 ohm (marked 0 or 0R0) : replace it with a 33 ohms. "

"Locate the SDMA (U36) under the floppy drive place. Locate the Clock trace arriving the the second pin from the left/rear corner (see the photo). Scratch the varnish (2 mm long) until you reach the metal, then tin it. Solder the 47 ohms (yellow, purple, black, gold) resistor (furnished) between the pin #14 of the AJAX chip (U20) and the clock trace like on the picture. The resistor must be closest to the SDMA and the pin soldered on the clock trace must be the shortest possible : it is termination resistor. "

"Some problems to solve (after you updated the ABE & SDR chips) :
- You hear some audio CRACs when running SDMATEST (2KB) at 50 KHz with 4 tracks. (http://www.czuba-tech.com/ct60/sdmatest.prg)
WORK AROUND : Solder a 27 pF capacitor parallel on the 47 ohms resistor of the SDMA clock."

Regards,

Didier.

Well, I guess its like the man said, "never rains but it pours".

To the list of programs that won't work with sound on my CT60 Falcon (Aniplayer, Doom), add my floppy drive. I didn't have a reason to use it before, but it seems to be deader than heck. I mean the access light is coming on but nothing can be accessed. It worked before the CT60 install, so I'll have to check more on that.

The good news is, the SCSI subsystem seems to be working just fine. I backed up my C drive using CDISO (part of the CDWRITER stuff from Anodyne) at 4X on my Plextor CDRW and it worked great. Done in just a few minutes.

Always a silver lining if you look hard enough. :-)

Well, as Didier wrote, you should check your SDMA... your problem with
floppy might be solved by turning off ï¿½floppy background DMA accessï¿½ or
whatsoever it is called under the OS you use.

Message-ID: <pan.2005.09.28.21.15.04.478605@charter.net>
Source record: 11014

Okay. All I did was copy the 68020 file instead of the 68060 file into the Aniplayer folder and suddenly I've got working sound. I tried a couple of AVIs, one MOV, and one MPEG (the mpeg didn't work, said something about a bad block, but it did try without crashing).

I've not had a chance to try an OGG yet, I'll give that a shot here a little bit later. Does Aniplayer support MP3s?

So my next question is - since it works with 68020, but not with the 68060, even though I've got a CT60, does that mean I probably still do have problems with the SDMA clock?

Thanks everyone.

I am an ST user and game collector, and I have had some very bad luck. A batch of ST games I won on Ebay had mold on the disk surfaces, and completely destroyed the floppy drives on both of my ST computers. (moral of the story, look at the disk surfaces FIRST before loading any second hand games) The drives are toast! Beyond cleaning or repairing.

I would be interested in buying any internal DSDD floppy drives that someone out there might have as extras. I am only interested in original Atari ST internal drives. I am not interested in converted PC drives, as in my experience they are a little bit dodgy on some of the more heavily copy protected games.

I am completely bummed out that I have no functional STs to use. This is the first time I have been in this situation in over 10 years! And I just got a bunch of new ST games in the mail that I ordered a few weeks ago. This sucks!

I am not interested in paying the $75 - $125 prices that the remaining ST dealers are asking for reconditioned and new internal drives.

I would like a total of 4 DSDD internal drives, 2 to get my STs running again, and 2 more as replacements. If anyone has any internal drives, with clean well aligned heads in good working condition, please e-mail me at STcomp@cwo.com. I can never have too many. I can pay by PayPal. Thanks. -STcomp

Okay, about MP3 and OGG files.

I can play MP3 files just fine. Clear, sharp, and Aniplayer is reporting about 10% usage. Is that about average guys?

Thats the good news. The bad news is, OGGs are unplayable so far. They skip, stutter and carry on. Aniplayer is reporting something like 461% usage. Ugh.

Same with MPEG, AVI, or MOV movies. Aniplayer is reporting something like 600 - 700% usage. Not good.

So the question I have to ask is this, does everyone still think that the SDMA clock is the problem, considering I can play MP3s? Movies but very slow, or movies at speed with sound turned off.

I appreciate any and all advice. Thanks! :-)

Hey, that's a cool idea.

A TFT with the right size, and a RGB/Composite/TV -> VGA adapter + some
wires internally. You could even make it support all 3 resolutions if
you're lucky.

I don't have a Stacy so I can't try it myself, unfortunately..

Dude,

Are you using the floppy cable from the mainboard? In that case, the drive won't work.
As described in the CT60 documentation, this cable shall be connected to the CT60 to provide 12V power to the mainboard. The floppy must be powered directly from the PSU.

Again, check your installation.

I I thought about that too :) It could be possible but the problem is to get right TFT and cheap one :)

So then it should be possible since STACY got full ST VIDEO compatible SHIFTER. But then I think it should have better POWER SUPPLY or more, better batteries :)

Well I got 620 version, but the author describe it should work.

But im not sure about DRIVERs, theres one for STING for sure but the version
exist is/was not 100% complete.

So maybe for MINT?

I just need info its worth to build adapter for D600 or due to not so good
drivers its not worth a penny ;)

Yes, I have it like that. The original floppy connector from the Falcons motherboard goes directly to the CT60 (with correct red and blue orientation).

The ATX power supply does run the floppy. Note that I can click on the floppy drive "A" icon, the access light on the drive comes on, it acts like its attempting to read the floppy, then Thing reports "unable to read Track A", about 2 times in a row, then says it can't do it.

Thanks.

4307. Mega STe keyboard maintenance

Newsgroup: comp.sys.atari.st
Date: 2005-09-29 16:46:50 UTC
From: Mike Maginnis <maginnis@tarnover.org>
Message-ID: <nv5oj193h5i5f0gh24kojmjjpb7thn76hg@4ax.com>
Source record: 11034

A little background: I was given a Mega STe a few years back but, being a Woz-worshipper, I never did much with it. The unit came without a keyboard and I remember spending a good portion of my lunch money on a new one. I fired it up a couple of times, poked around a bit and then left it to languish in the basement until late last night. At some point during those years of disuse, the keyboard apparently shuffled off this mortal coil.

Does anyone have any thoughts or simple troubleshooting tips? I have no intention of doing anything other than the most basic tasks (i.e., cleaning). Anything requiring a soldering iron, mucking about with firmware, etc. is right out.

Yes, it will work. I sometimes use a LaserJet 2200 (a bit newer than the 4050N) with my TT, and the drivers (NVDI, TempusWord) for the older LaserJets work fine, at least for 300 and 600 DPI.

While we're on this subject, the HP 1160 and 1320 both support PCL5e. As such, both are very likely to work with NVDI. The OkiData 4200 and 4300 series also have this support. Brother printers no longer do, although they have FX emulation, which should work at least for text. Finally, there's the Epson FX impact printers, which of course use FX print language. They are loud, but should work fine with an Atari.

I remember that this was a known issue with some (early?) batches of 1040s.
In order to solve the problem a modification on the motherboard was
required.

I am very bad at German, but I believe that the following paragraph(s)
describe the problem and the solution (text taken from Chips 'n Chips):

Bildschirmflimmern

Bei verschiedenen Älteren Systemen, kann nach einer gewissen Zeit
ein Bildschirmflimmern auftreten. Dieser Fehler tritt in einem be-
stimmten Temperaturbereich auf. Beim Austauschen von Videoshifter
und MMU wird dieser Bereich nur verschoben. Um Abhilfe zu schaffen,
wird ein Kondensator im Wert von 5-10pf (Picofarad) an Pin 39 vom
Videoshifter gegen Masse gelötet.

Wer sagt mir, woher es kommt, daß bei Plattenzugriffen der graue
Hintergrund des Monitorbildes leicht flackert ?
RESET-Signal am DMA-Ausgang über einen 7407 (kein LS!) mit 1 kOhm
gegen 5 Volt verstärken, dann treten diese Effekte nicht mehr auf.

Bei Flimmern, Grieseln oder Sternenbildung auf dem Schirm ?
An Pin 36 (16MHz out) des Videochips einen Kondensator von 10-120pF
gegen Masse einlöten. Der Wert muß ausprobiert werden!

>> Umm, I made a feeble attempt to answer this at Atari Age, but basically
>> what I said was try the time-honored tradition of raising it a couple of
>> inches in the air and dropping it on a hard surface.

Plese don't do such a silly thing- it is likely to break more than it
can fix. It is not the way to treat a piece of delicate electronic
equiplemt- especially if it contains moving parts (such as the floppy drive)
which do not suffer high accelerations lightly.

>> you'll eventually need to open it up and reseat all the socketed chips.

This is a much more sensible approach, possibly even for for preventive maintenance (though it will not fix the flicker problem)- indeed, due to thermal cycling, the chips are likely to slowly creep out of their sockets. Pressing them gently back into sockets may also scrape the oxidation from the pins, improve the contacts and cure some erratic behaviour. Dropping the computer from a certain height is supposed to press the chips into sockets too, but as the chips have fairly low mass, the deceleration would have to be very fierce (i.e. should be dropped from a great height to a very hard surface) in order to push the chps back into sockets.

I finally got it to work!!!!

I had to use a older Quantum 105s and removed every jumper. First time
on it worked. After it worked I installed the terminators and started
it back up and its still running.

So to everyone it can be done as long as you have the right drive. I
wish it would have been a bigger drive but, it just wouldnt work..

Both drive IDs at ID0. the controller is used to select the ID.

Thanks

Yeah it takes the Hades about 8 hours to install the base and the Gnome desktop environment. Luckily I did not need the computer for anything.

Probably the keyboard, though I don't really have a way to check. I
get no response from any keypresses, and the mouse cursor won't move.

Hi,

Check out Lilliput, they might make a screen big enough, I know they do
little 8" screens that take in VGA and composite.

The chances are that the rubber cup is torn near the carbon bush
that actually makes the contact to the motherboard grid. This is
quite common for heavily-used keys on Ataris - I've had to replace
over a dozen on 3 machines. If you can, fit a replacement. Best do
a nice set of 'TT Keys' with stiffer 'springing', but are a little
expensive. If you can't find another keyboard to canibalise
(actually it might be worth while buying another ST from a thrift
shop or similar) then swap the 'V' cup for another one you seldom
or never use, such as the accent grave/macron next to the
Backspace key.

Okay thanks. I'll have to look around and try to find it.

I've had some partial success. Without doing anything but changing the 68020 file for the 68060 one, I can play MP3s, with about 10% usage according to Aniplayer. The sound is clean and sharp. Here is the ugly part - if I try to play .OGGs though, the usage goes to 460% or higher and it continuously replays part of the song every couple of seconds before moving on.

This now applies to movies as well - usage goes to 700% or higher, and the movie video/sound replays itself, skips, etc,...

Since I can play MP3s, with low usage, and very clean sound, does that mean I still probably have a problem with the SDMA clock, or perhaps I just don't have Aniplayer (or something else CT60 related) set right?

I still can't play PMDOOM with sound either. Rocks, very playable with the "-audio off" switch in use though.

Thanks everyone. :-)

> this?
Nope.
And it makes me afraid of what a Mega STe would go for, let alone a
> TT or Falcon...) I'd bet that shipping on it was c. $50 as well...

Yep, I bought the Mega ST 4 with 30M harddrive. Neither work. And the
1600 games and other programs that came with it. Nearly all useless
diskettes.
Sometimes you win on eBay and sometimes you tale a licking. But where else
are you going to get old computer stuff at prices that affordable. In the
long run,,
I come out OK, even with some miserable buys (about one-third of the time).

4333. BetaDOS drivers in aranym/AFROS - please help

Newsgroup: comp.sys.atari.st
Date: 2005-10-01 07:22:39 UTC
From: Ludwig Maetzke <Ludwig.Maetzke@gmx.de>
Message-ID: <3q6rnkFdhnfiU1@individual.net>
Source record: 10910

Hi,

in the aranym/AFROS package there is BetaDOS included with a driver that allows accessing files with long names in Linux folders without MinT, only with TOS 4.04 and BetaDOS installed in the AUTO folder of an aranym partition.
This worked on my former Linux system and now I need this BetaDOS driver for testing with the emulator TOSBOX running from MS Win 98. This could be the solution to access the files with long names of the VFAT system.
Because I can't extract single files from the AFROS diskimage, I need help from people who have aranym/AFROS installed.

TIA, Ludwig

Hello all,

This is for all you Mint/Mintnet people. I have mentioned that my Mint setup had gone bye-bye. I did back it up and will re-install everything, but I have a little problem. For some reason in the Mint environment, if I try and write something to any partition, floppy or otherwise, the fat table seems to get messed up. All the file names turn into garbage. I have a setup where I can boot up Mint without Mintnet, so I can view an EXT2 partition. I tried to change a file name on the HDDriver utility program and that wiped out the whole partition fat table. Luckily I was able to re-install everything back with some backups I had. Anyone know why this is happening? The last time I tried to boot up MintNet, all the files in the Mint folder was wiped out. Below is my mint.cnf file. If there is anything funny in it, please let me know. If it is ok, then it must something in my auto folder that is doing it.

```

Hi,

I noticed that there was a list of AUTO folder programs on his web
site. Does anyone have any 'bit' settings for any programs using
FILEINFO.CPX?

It would be nice to have the list (as a table) redone with FILEINFO
information. Something similiar to:

(This is not actual settings)

Pagestream1.8b Fastload:NO TTPRG:YES TTRAM:NO

Does anything like this exist? Should there be one?

Thanks
Rory

Thanks. I did most of the cleaning, but still need on working out a way
to free the mainboard.

The keyboard went through cleaning, and everything seems to be working ok.
The rubber cups didn't look to be in that bad of shape yet, but yes, if I
can find a plain old ST at a thrift shop locally somewhere, I'll probably
snarf it up for parts. (Actually, I, briefly, tried this before
resorting to ebay for the STe, and didn't even see anything Atari. I
even hunted through a local flea market(HUGE) hoping to find someone
selling some old systems, but no such luck other than a couple of vendors
selling NES and more recent vintage video games...

AFAICS Ataris are pretty rare on the ground in the US... that or they're
still sitting in someone's attic/basement/garage or have already been
landfilled... (I should've tried that Atari swap meet in Ohio, but it
would have been a longish(and expensive) drive for not knowing what would
be there... I'll have to look around SW Ontario when I get a chance as
well...)

As I wrote a few days ago, I have the same problem with Aniplayer and OGG:
OGG doesn't work (aniplayer can't find the SLB!) with 060 OGG SLB, but it
works (Sssslllloooowwwwwww) with the standard SLB.
No problems with ANY OTHER SLB. And my SDMA is just fine! (ask Rodolphe :-)
)

Hmm, how do you know its not finding the '060 version of the SLB? Maybe
thats my problem as well. If I try to play an OGG, it reports something
like 460% usage and skips badly.

Does fine with MP3s.

Thanks.

Don't use VFAT on the boot partition.

What is this? Gluestik drivers or what? That's really old stuff. Get
ride of that. Use gluestik.prg as found in the freemint 1.16.1
release.

Note, your reported 10% cpu with MP3 is due to DSP. Try to disable DSP, u
will get much higher cpu usage for MP3.. and 460% usage for ogg just means cpu
is too slow ;) (or that the routines are slow ;) OGG is afaik more demanding
as MP3 and that may be a problem

Well if u use MiNT (i think Magic offer that as well), u better Load/Unload ACCs on demand. I use preety small number of ACCs (STGuide, Freedom, Control Panel and NewAlert) and load others if needed...

Well lets imagine i understood this :) Imho u should use Signum. Great text processor, also very features packed. Maybe some older (4) version will eat even less memory as latest... If u need less features, i would go with Everest editor....

```

This also calls for trouble, this GS is old, VERY old, use PRG included in MiNT 1.16.x...

I repaired a Mega STE keyboard which had a broken track on its membrane with the product used to car fix rear window demisters. Obviously you would first need to discover if there is a faulty track! A visual check could be enough or a multi meter to test continuity. Of course dismanteling may not appeal?

4355. TT, Debian 3.1, ethernet

When playing around with the Debian 3.1 installation CD I noticed that
the Riebel ethernet driver is not installed during the installation
setup. Is this driver not included in the Debian distribution anymore?
My old setup (with kernel 1.0) still includes this driver.
Hints how to load the Riebel driver module in order to run/continue the
installation are appreciated.

rev6 060 can go up to 100, 105 was reported as well. But most of rev6 are stable until 95mhz. Mine works ok at 100 BUT tends to do some unexplained freezes at random time...

You can get a small stiff glass-fibre brush specially made for
cleaning contact pins and PCB tracks (mine came from Maplins, but
most electronic parts stores should have them). There is also a
switch-cleaner spray available that removes oxidation on pins etc.

>> V key is not registering. Any common problems with keyboards other than
>> to try to clean it, hope for the best, then replace keyboard failing that?

>swap it.

Agreed that another keyboard is much easier, but repairs can be
done with a bit of care. Make sure you rest the very edges of the
keyboard on a coupe of thick books so that none of the keys are
pressed down when you remove the PCB after undoing the 30 screws.
And do that carefully, hinging it backwards (away from the edge of
the table) so that any rubber cups that are sticking to the PCB do
not fall on the floor. As I said in an earlier posting, it's quite
possible that the 'V' cup is torn if it's seen heavy use, and if
you don't have a spare, change it for one of the keys you
seldom/never use, such as ` (next to Backspace).

Regards, /Peter/

DDP Translations at your service! [Items in square brackets added]

Screen flicker

With some older systems [i.e. hardware], screen flickering
can occur after some time. This fault appears over a given
temperature range. Swapping the video shifter and MMU merely
alters this range. The remedy is to solder a capacitor with a
value of 3-10 pF (picofarad) between pin 39 of the video
shifter and ground.

[Q] Who can tell me why the grey background of the screen image
[A] flickers slightly with disc accesses?
Amplify the RESET signal at the DMA output via a 7407 [IC] (not
the LS version!) with 1 kOhm to 5 volts, and the effects will
no longer occur.

[Q] Flicker, tearing [?] or star formation on the screen?
[A] Solder a capacitor of 10-120pF between pin 36 (16 MHz out) of
the video chip aand ground. The value must be found by trial
and error!

Regards, /Peter/

>my commonly used programs with one key stroke?

Well, the latest version 1.29 of the Thing desktop (shareware)
allows you to install single 'Quick-start' keys, but unfortunately
the 'Extra/Quick-start key' menu item is not described in the HYP,
which is for V1.27. And I haven't found a way to make it work :-(

But you can have 10 more by allocating the function keys F1 to F10
with the 'Extra/Function keys' menu entry.

However, if you allow not *one* key but *two*, you can install another
30 with function+modifier key in 'Extra/Function keys'. From the HYP:

"This dialog offers separate pages to assign Function keys alone and in
combination with [Shift], [Control] or [Alternate], as well as allocating
entries in the 'Tools' menu.

"Key allocations are evaluated as follows:

"If only a filename is entered the relevant file will be opened when the
key/combination is pressed, taking into account any applications installed
for it.

"If the file is a program then it will be started, of course; optionally
one can also specify here any command line parameters to be passed."

Finally, the 'Extra/Applications' dialog allows up to 9 programs
to be launched with ALT+number key. From the HYP:

"Shortcut: In this popup menu an [Alternate] + number key combination can
be assigned as a keyboard shortcut to launch the application...."

If you don't use Thing, the (commercial) Jinnee desktop offers
similar facilities.

With other desktops, macros can be executed with the help of the
Harlekin desk accessory, which allows you to define your own. This
was commercial, but has been on cover disks and I think can now be
found on the web.

I have used a Canon bjc-2000 for a few years. I use the bjc-620 driver but
have tried some of the others in NVDI.

I works fine in 360dpi mode but printing in 720 dpi mode results in
tall images.

This problem was discussed with 2B and they blamed the application but
since it was happening with all the apps I tried it could only have been
the driver.

4365. WTB: ScreenEye Digitiser for Atari Falcon030

Newsgroup: comp.sys.atari.st
Date: 2005-10-03 01:29:28 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <6O%%e.5522$ff7.1587@bignews4.bellsouth.net>
Source record: 10942

Looking to buy a ScreenEye Digitiser for Atari Falcon030.

I am in the USA and doubt that anyone in the US has one for sale,
but if so contact me with price.

I thought that I might find someone from overseas with one for sale.
If so, do contact me as I am most interested in finding a good
working one to buy.

I also will buy non-working ones as well.

I have the general software for it, but I think it's in German, so I
would
like a English version of the software if possible.

If I am not mistaken, the ScreenEye was made by a company in
Germany and sold by Titan Designs.

Anyhow, would very much like to get one or more of these.

Contact me with info and asking price.

Thanks,
phantomm@bellsouth.net

Well I am still having a little problem in getting the X11 environment to come up. I had it up and running a few years ago when I ran the Slink version of Debian, but Sarge is much bigger and may take me longer to figure out. People on the Debian usernets say it may have to due with memory. I have 256meg of memory, so I think it is another problem possibly in my boot argument statement. The rest of it comes up fine, I just do not have a desktop enviroment yet. Also, my sound and ethernet cards are not recognized, but when Linux does a PCI scan, the hex numbers come up fine for each card. When I get it all up and running I plan to compile a new kernel which I hope will solve all this.

It basically looks like a cap that covers the joystick port and connects a combo of two or pins together. I remember reading an article about how to make one on the NET.

>installation are appreciated.

I am fiddling around with Debian 3.1 also on my Hades and do not remember that loading with. Infact, my Realtek Ethernet card is not recognized either. It may have to do with the fact the module is not yet built into my kernel which is old (version 2.2). I notice that kernel 2.6 has some eithernet modules in it but I cannot use it until I compile it for my Hades. What kernel version do you have? You can get on the Debian website and look up your kernel and go inside and see what modules it contains. I know you can load in modules, but I am a beginner also. I did just get the Sarge to install on my Hades and it works fine except for the X11 environment. Are you using CD rom's? I would think the driver you want is on one of them. I know the "dpkg" command loads in and manages the packages of the Linux system. That may be a way to put it on your system after you install it.

Hi Edward,
T Bird is alive and well and a regular poster at Jaguar Sector II Forum, he has indeed been the target for criticism in the past which has clouded his attitude toward the Jaguar fan base, rightly or wrongly I cant tell cos I wasnt on the scene at the time this was all happening.

I have noted he still puts the occasional copy of Battlesphere gold up on eBay and they always go for in excess of $500 so he still has some stock of them. Ive seen 2 sold by him in recent months. Under his e bay ID which is something like Misterincredible or Captainawesome or similar. All the time he can make $500+ a copy you can bet he wont be interested in selling the rights.

Scatalogic/ 4 Play T'Birds company that developed Battlesphere are still a going concern and so the copyrights to the game are still actively protected.

I did (briefy) consider finding some sort of box that would do this
but I don't really want to add to the clutter of wiring.

I am looking for a 802.11g wireless nic that is either Realtek rtl8193
or NE2000 compatible.

I currently use the rtl driver but assume the ne2000 will work just as
well.

I have downloaded the Debian 3.1 net installation CD, which offers a 2.2
and a 2.4 kernel. I want to use the 2.4 kernel. What I am doing right
now is compiling a 2.4.31 kernel on my TT, which has all the drivers I
need included. I should then be able to use my own kernel for the
installation process.

> works fine except for the X11 environment. Are you using CD rom's? I would

For a start I just want to check if the 2.4 kernel works for me at all,
before starting the time-consuming installation.
This is a waste of time anyway because I do not really need a 2.4 kernel
;-). I just run Linux on my TT because it is a quite convenient way to
back up my TOS partitions by transfering them to my PC via Ethernet.

AFAIK, the Hades060 needs fpu__3.prg to emulate some missing
FPU-commands. You really needs it. I start it once from autofolder
(very first prg) but as MiNT kills fpu__3.prg I restart it again from
mint.cnf

> talking about before spewing such nonsense

So okay, since some people just DON'T get it, allow me to explain. The guy is looking for a Mega 4 and a Link 2. Since a Megafile 60 is a lesser drive/controller compared to a link/2 and what it can offer you, it should in theory be worth less. Therefore the guy was pointing it out to indicate that what you are asking for should cost more than double what yo uare willing to pay. The computers are the same part of the equation. There's nothing I love more than people yelling at other people with no reason at all.

Okay?

Will this work? You need some way to select network, configure encryption
(if needed) etc. I don't know how this is done in Linux, with ifconfig
perhaps? Anyway, I don't think any current NIC-drivers for MiNT-net
support wireless NICs.

Source record: 10876

This subject came up some time back, and I finally managed to get around to experimenting a bit with my CT60 Falcon.

There is mixed news here.

The movies I made from VideoMaster Falcon about 10 years ago, all play just fine, using the small .TTP player program included with VMF. This is under plain TOS. Under MINT/Thing, they play, but when they exit out, the desktop pallette is mixed up. Its easily fixed though, by just quitting thing and restarting it. (this is with NAES v2.0).

The bad news is, that currently, I can not get the main program to run correctly *anywhere*. Under TOS, or MINT/Thing, it will start, open up its main window, and the refuse to respond to any mouse clicks. The mouse cursor moves, you just can't click on any tabs, buttons, nothing. So you can't even exit out from it. I had to reset each time. When it is running, I am getting sound from the VCR coming through my speakers. No video though. I'm not sure if its something I'm not doing right, or something I've got hooked up wrong. This is a Wizztronics case with the cartridge port extended to the rear of the case. I've double-checked the red pin/cable and its correct. I've also got the MB mod, don't know if that affects it or not?

I'll play with it some more and see if I can figure something out.

If anyone else has any suggestions, I'm more than open to them! :-)

I'm not sure a pic would show much. It small plug with a standard 9-pin joystick connector on one end and the other end capped off. Mine is roughly .6" on each side and .3" thick and is black in color with a red cap. Only text of any kind I could find says AMP in rather small letters. Hope this helps.

A small point of order... it's not really the acceleration that's the
problem.

As a friend who tests elevators is fond of saying, it's not the fall
that'll kill you. It's the sudden stop down at the bottom! <G>

I did some extensive digging yesterday and you are probably
right about needing some extra tools to configure the driver/
card.

There may be some cli ones that could perhaps be ported but
without a driver it's not going to be a lot of help.

Peter

Actually I just found this thread:

http://lists.samba.org/archive/wireless/2003-October/002653.html

which suggests that the wireless nic can be configured using
ifconfig. I don't know if the Freemint version of ifconfig
would support this at the moment.

According to Einstein the immense decelaration you experience
when hitting the ground is just the same as if you were immensely
accelerated by the ground suddenly shooting you up in the air. :-)

So if one talks about high acceleration one is almost always talking
about hitting something. :-)

Hey Patrice,

I actually did read the docs, and I'm a huge fan of your work. However, as I understand it, xbios audio should work under MiNT, but I don't get any sound at all...
- something to do with threads? The SDL lib used when compiling doom had threads disabled?

I may have misunderstood something; after all, my native tounge is not english..

4419. MagiC and CICON data

Newsgroup: comp.sys.atari.st
Date: 2005-10-06 22:15:17 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1128636917.104260.11530@g14g2000cwa.googlegroups.com>
Source record: 10893

Hi all,

I am hoping Andreas Kromke or any other MagiC wizard may be reading
this forum still. The question I have is as follows:

When I load an RSC file containing CICONs, I use RSRC_LOAD(). Now,
under XaAES/NAES this call ensures that the CICONs loaded image data is
also converted to device dependent format. However, under MagiC, this
is not the case. (If I try to blit with vro_cpyfm() directly from the
RSC icon image data, I just get garbage on screen. With N.AES and
XaAES, the gfx output is perfect though)

Does someone know if MagiC does this conversion for each and every
OBJC_DRAW()? Or does it store the converted image data in a buffer
somewhere? If it does, where?

Please help!

/Joakim

Please note that not only programmers but also pure Debian users are
needed now. Right now Debian needs to see at least 50 users or they might
stop the entire m68k port (and that would basically mean end of Linux on
Atari).

http://lists.debian.org/debian-68k/2005/10/msg00002.html

Please if you are using, trying to use, plan to use or have been
using Debian Linux on Atari then don't let it die.

does it mean that you got X11 running? On what graphics card? Starting GNOME would then be a matter of "apt-get install gnome gdm".

Also I'd suggest you (for perhaps third time) to join the debian-68k mailing list to discuss the debian issues on Atari and also the linux-68k list to discuss kernel related problems. You must have figured out already that the debian and kernel developers do not read this usenet newsgroup.

This would only work if TOSBOX implemented the HostFS NatFeat.

> Because I can't extract single files from the AFROS diskimage

Why you can't extract it? Simply boot ARAnyM/AFROS and copy the files over
to your host filesystem, or just a plain floppy.

Also, the binaries of the drivers are available in source distribution of
ARAnyM. And they're even accessible via the web interface to the CVS
archive.

I have both of these games and the dongles,

Basically, they look like an Atari 8 bit joystick end. Only abit
smaller, and just a wire or two inside
to make a connection. They are very light and almost seem hollow. Mine
is stamped with a AMP
Logo and it looks fairly easy to take apart.

Of course it has the standard 9 pin holes to connect to the ST
Joystick/Mouse port.

One could probably make there own. If you want me to take mine apart
and describe
whats connected inside, just let me know.

For a reason I do not know the new kernel did not boot. I decided to
stick to my old Debian installation, which is sufficient for my needs.
Compiling a kernel etc. on a TT simply takes too much time to do it more
than once ;-).

I recently got another VIDI ST cartridge in very good conditon with the original box, software and manual.

I've not tried it out yet, but I notice that its design is somewhat different
than the other Vidi ST cartridge I have. This one is smaller in size and the
Label is different. Both Carts are black, but don't really look alike.

Anyone know if this change is just the outside cart? Or was the circuit board
also updated?

Hello,

Slightly off topic this one but wished to post this here where it wouldn't be subject to the regular newsgroup trolls, conspiracy theorists and general lunatics. You're respected!

While developing PeST I've ended up with quite alot of what would be mice leads (we use a PS2 extension cable and cut it in half for the socket end). I've been wondered what to do with the spare bits.

It's occured to me that I could develop a pretty simple mouse pointing device for those who are disabled or impaired. And do it quite cheaply too.

While briefly researching this topic I have to say I'm absolutely shocked at how much companies charge for products to assist the disabled, it's almost as if it's the next financial money spinner and seems very unethical somehow..

What I was imagining here was perhaps something with large buttons for left right, up down, and the two mouse buttons. Or something with light sensors being covered etc.

Any ideas? Any experience?

Thanks,

Aly
http://www.retro.dial.pipex.com/pest/ (quick product plug which I'm at it..)

Sorry if this stuff is obvious but I've had problems with mint.cnf
in the past and it was almost always soemthing really easy that
I just couldn't see.

If your main mint partition is not M: then you will also need to
change these lines:

```
# Links zu EasyMiNT
sln m:\bin u:\bin
sln m:\lib u:\lib
sln m:\etc u:\etc
sln m:\home u:\home
sln m:\usr u:\usr
sln m:\tmp u:\tmp
sln m:\var u:\var
sln m:\sbin u:\sbin
sln m:\root u:\root
sln m:\opt u:\opt
sln m:\mnt u:\mnt
sln m:\boot u:\boot
```

A few years ago I tried to install Debain on my Milan.

The problem was that the installer would crash and lock-up the entire system.
It was very disappointing to find that the installer wasn't capable of doing a few
basic things without crashing so badly.

I had a bit of a chat on the m68k linux mailing list but it wasn't a lot of help.
IIRC they said it was crashing because the system was not recognised. I thought
it was poor that the installer couldn't handle this situation and I gave up.

That was when I decided to enhance my minimal Mint installation with EasyMint.

I also had a quick look at one of the BSD systems but the installation was a bit
more manual and put me off.

If I ever get FreeMint 1-16 running properly I may give BSD another go.

Hi all,

Just bought an external 100mb ZIP drive for my Falcon and now need a cable. Can anyone tell me which flavour of SCSI cable I need to buy, SCSI I, II or III? The Zip drive has a 25pin female socket and the Falcon a 50pin socket (Very small pins - ultra SCSI?)

Thanks in advance.

Dave.

Cables/Connectors cant really be reliably described by saying SCSI I,II
or III.

All you want is a 25pin to High Density 50pin cable.

Coda.

4443. Falcon floppy cable extender?

Source record: 10820

I know some others of you have re-cased yor Falcons. Where did you get the extension cable for the floppy drive?

The other Falcon I had (the one I just sold) had already been re-fitted by someone else with a standard floppy header so it was easy to find a cable long enough to move the floppy.

Now though, my current Falcon has the standard Atari floppy header, and I can't find an extension cable that will work. I've got 3 floppy cables that have a header on one end that plugs into the cable coming out of the Falcons' MB, and the other end plugs into the floppy drive. None of them seem to work though. Using any of these cables, I get an error from TOS or MINT/Thing that track A can't be read. Plug the floppy straight back into the cable from the Falcon and it works just fine.

I've already sent an e-mail to Brad at Best Electronics but I just wanted to see what others have done.

Thanks everyone.

Hi Galen,

Thanks for your reply. Oh it's just an idea really.

Oh California, no probs there, please do just bounce this off her but only in passing :-). The device I was wondering would have 4 large 2cm dia. buttons for direction, and 3 for mouse buttons, 1 left but, 1 right but, and 1 left double click. Say a case size of 25cm x 15cm, something that was sturdy and could be used by the feet maybe.

Thanks again,

Aly

Yayyyyyyyy :-) Happy customer :-) There's probably about 40 of them out there now. Quite a few in the USA, a few in Austrailia, and sent one to Singapore last week. Singapore!! Odd place for an ST I wondered but the guy sounded happy. :-)

Thank you for buying, really pleased that it's meeting expectations. :-) And for that money doesn't compare.

Probably not. The Zip drive takes a DB50, I think. The Falcon end is
shown as a SCSI 2 in the Best Electronics catalog, and is otherwise known
as a HP50 or HD50, depending on where you look. Both ends should be male.

One place to find such is Cables To Go. They have a website. So does
Best, who may have one to sell.

Hi,
This is the description of the one I'm looking at...

-- This cable is SCSI II 50 HD M at one end and 25 D M at the other.
-- Suitable for connecting a scanner to a SCSI card.

This seems to match the 50pin Flacon and 25pin SCSI.

Cheers
Dave.

Hi Rory,

Didn't you just know someone would ask you a nasty question?! :-) This one concerns KVM usage.

Referring to your KVM usage here;
http://fujiman.no-ip.com/Eiffel_FAQ.htm

Why doesn't it work? Is there no error recovery code implemented in Eiffel?

Reason why I'm asking this is that I'm trying to unravel this one fully myself. It's partly explained here but doesn't apply to all digital KVM's, only some; http://www.retro.dial.pipex.com/pest/q&a//index.htm

I'm assisting a customer in determining if Eiffel or PeST would be best for them. They would like to use a digital KVM but I know that only the KVM's which don't mess about with the PS2 packets will work.
Technically Eiffel would work with some digital KVM's in the same manner that PeST will, in that some digital KVM's behave identically to manual KVM's. This centres around how you initialise the mouse, as you have to be able to detect a disconnect in order to enable Status-Reporting else your mouse will just sit there. PeST will detect this. If Eiffel has problems with ALL digital KVM's then this has got me worried somehow.

Any ideas?

Thanks,

Aly

> about before spewing such nonsense

hmmm.. let me see...
Mega ST4 == Mega ST4 check
Megafile << ICD Link (free clue, how many drives do you think that
you would be able to find that would work in a megafile v. SCSI? IIRC the
MFM drive used in a megafile is NOT compatible with IDE, meaning that
you'd either pay ALOT for a new drive if you could find one or pay ALOT
for a used drive of doubtful provenance.)

so, we have a more limited system that went for $275 USD on ebay ~1mo ago,
and this guy is offering a measly $100 for a much more flexible system
with the only difference between the two being one sold with a megafile,
and one that wants an ICD link which look to be rarer than megafiles ATM?
WTF?!

(This was MEANT to left as a trivial mental exercise for the observant
reader to figure out on their own.)

P.S. I hope that the multisyllabic words and contractions don't confuse
you.

There are no nasty questions... At best, I can give an answer, at
worse, a wrong one. So fire away. LOL...

>Referring to your KVM usage here;
>http://fujiman.no-ip.com/Eiffel_FAQ.htm
>
>Why doesn't it work? Is there no error recovery code implemented in
>Eiffel?

I dont know if there is any code in the eiffel firmware for recovery.
I have not had a chance to look through it. I would imagine it has
some. I have tried hooking one up to a non powered kvm (one that does
not have a power adapter), where the keyboard would work, but the
mouse would not. I will have to run a few more tests and see if the
board may need modification. If the kvm is pulling power from the ps/2
port, im wondering if the atari can support more power or is there a
limit for the keyboard circuitry. And why the keyboard works, yet the
mouse doesnt?

>Reason why I'm asking this is that I'm trying to unravel this one fully
>myself. It's partly explained here but doesn't apply to all digital
>KVM's, only some; http://www.retro.dial.pipex.com/pest/q&a//index.htm

Perhaps that there may be on digital kvm that would work. I dont have
the resources to procure and check each one. The one I bought
(miniview 4 port) doesnt work fully with the eiffel. I pretty much
stopped there. I had already bought the cables, so it now is hooked to
the PC's I have. I went and bought the mechanical one for $17 at a

local shop and it works fine. There is definately a need to see if
another works, but only if time/funds permits.

Or, design one to use some soft touch buttons and solid state relays
to switch signals. Another PIC project? Anyone?

>I'm assisting a customer in determining if Eiffel or PeST would be best
>for them. They would like to use a digital KVM but I know that only the
>KVM's which don't mess about with the PS2 packets will work.

Well, I think we all agree that the Atari mouse rates a -10 on a scale
of 1 to 10. I have gotten better resolution with a string tied to a
brick. Anything is better than the Atari mouse. I would much rather
use the keyboard...

I think Didier may have wrote and updates the firmware for the Eiffel.
I have not asked him if the code will support a digital kvm. It may be
in the works. As for writing code for a PIC, um, I cant do it. I'm the
guy who sometimes picks up the right end of the soldering iron. Those
days, I put some boards together, test em, and send em out. The other
days, I nurse the wounds and try again soon.

>Technically Eiffel would work with some digital KVM's in the same manner

>be able to detect a disconnect in order to enable Status-Reporting else
>your mouse will just sit there. PeST will detect this. If Eiffel has
>problems with ALL digital KVM's then this has got me worried somehow.

Well, I would like to get these little things ironed out in the near
future. I'm not sure how much of the firmware would need an overhaul.
I'm not able to do this. The Eiffel is open source, so it is available
to everyone who wishes to modify to suit. Meanwhile, the manual
switchbox is working. We have some APEX boxes at work, so I could try
it out there. I'm not sure if people want to shell out a lot of money
for a APEX. The box would cost more than the computers combined. LOL.
The mech-switch box is a cheap & easy solution. Yes, they wear out,
but it is pretty cost effective. Until I find one that works properly,
I will probably use a manual switchbox.

Ok, its late here and I'm rambling... Somebody cut me off! :)

Rory

I unsoldered the attached cable and put a dual row header. I then
modified a PC floppy cable by reversing the 9 through 16(i think)
wires in the cable. A PC cable A: drive has the wires reversed. You
just switch them back to normal cable. I've taken a few round cables
and they work fine.

I can do this if needed.

Thanks
Rory

Yes I have done that. I put my vote in and I noticed the count was almost up to 40, so here's hoping it gets to 50.

I don't know. But I know that there is no doc which say what format the CICON have after you load they with rsrc_load. So you must use objc_draw.

Since I have an a Mac Mini I use a TK-210K (TRENDnet) switch who works
fine with my current unfinished release of Eiffel. Sometimes there are
problems during reset, the mouse not works. Normally it's OK after
another reset.
I have no time for finish this update since I work on the CTPCI drivers
(today the radeon driver). So please wait some months (like the
Aniplayer DVD release).
About Eiffel you need to select the set 2, the set 3 has no chances to
works with KVM switchs.
The TK-210K use a PS2 mouse/keyboard for switch between USB machine and
a PS/2 machine.

Regards,

Didier.

I quite like that answer :-) Very honest.

Yep, agreed, digital KVM's which pull their power from PS2 ports galore would definitely pose a problem. Mmmm, hadn't thought of that. I used to work for a big ISP on Cambridge Science Park and we had racks and racks of servers, the digital KVM's used to cause us all sorts of problems so we went back to PCAnywhere/variants for an easy life. Couldn't have live hosting servers becoming randomly unaccessible, was a bad move really although they were left in place and we took a chance.

I think thats what somebody had done to the Falcon I sold. It worked great, except that, as you mentioned the wires were reversed. Since it will fit, I just flipped the end connector over before hooking it to the floppy itself.

Let me see if I can find/obtain a cable that will work first, then if I can't, I might take you up on your offer. :-)

Thanks much!

Thanks for replying Mike. I played around with the flags on it, can't seem
to come up with a combo that works.

I do have the DEKA interface in my recased Falcon. I'll switch out to a
standard keyboard when I get a chance and see if that makes a difference.
10 years ago, I had a Nemesis equipped Falcon, and IIRC, VMF worked okay
with it. Wonder what it is about the DEKA that it wouldn't like? I don't
think I've encountered any other software that doesn't work with it.

If these are cables from a PC, have you tried plugging them into
the drive upside down? ISTR that for some reason there is a
difference on the Atari from PC. Also, make sure that the cables
don't have any wires crossed. Are these the usual flat cables with
cripm-on IDC connectors?

From: vdjole@EUnet.yu
Message-ID: <dibol0roh1@news.eunet.yu>
Source record: 10847

Hi;

Apparently Mint permits the user to create a symbolic link in a FAT
partition on which "NEWFATS" handling is enabled and "VFAT" extension is NOT.

Is it wise to use this capability if such a partition is later to be accessed
from single-TOS as well, or would it be eventually considered as corrupted
in single-TOS;

Thanx in advance.

cu;

Source record: 10848

Hi,

As Lp mentioned this is covered in the Atari Compendium. In Appendix-C
(Native File Formats) you can read the following:

"CICON Images

All color image data is stored in VDI device independent format on disk
and is automatically converted by vr_trnfm() upon rsrc_load()."

Hence we are facing yet another shortcoming of MagiC it would appear.
However, I presume it should be possible to manually call vr_trnfm() if
MagiC is detected.

I have a question related to MagiC and color icons; Does anyone know
why some applications, Papyrus for example, does not get color icons
under N.AES (and XaAES)? I have tried to investigate this, but ended up
just as clueless as before I investigated.

Best Regards,

Hello all
I will be recasing my Falcon soon as well and was wondering about the floppy cable myself..Is the floppy cable thats in the Falcon fixed to the motherboard? I was going to remove it but didn't want to rip it out (I think i saw in a post someone did that) do i need to get a header (the pins) installed? and if so who/where can i get that done for a reasonable price (NO WAY am i going to attempt it) Thanks in advance :)

Yes, I have - in fact thats the only way they will work. If you plug them
in the other way, the access light on the floppy drive never goes off.

Hi Thomas. Yep, its attached, and its not a PC standard header. You can
either find a cable that will extend the current Atari one, or replace the
header with a standard one as has been mentioned.

Er, no - it plugs into the cartridge port and nowhere else. It doesn't use
the joystick ports at all.

I don't know if I can run TT Digger or not. I don't even have it, never
used it before. :-(

Ok thanks for the info..
Guess I need to holler at Best since if I was to want the header put in
no one around here could/would do it (in Knoxville TN) I only hope my
CT60 experence goes well but no idea how i will upgrade the cmos (was
hoping to get the USB/ethernet card from Nature) but will cross that
bridge when i get to it :)
Thanks again
Thomas

Thomas,

I can install the header if needed. I live in Illinois and would have
a quick turnaround. If you are installing the CT6x then I can update
the required parts.

There are 2 pots for Contrast and Brightness and a small adjustment for
Scan Width.

The 2 Vidi ST carts I have will capture Color. If you use VideoChrome
and etc, you get more
options for Color Grabs, IIRC.

I have one Splitter for a Vidi ST Cart. Its a nice splitter, and has
some built in features
that one might could use for sometype of video project. It looks more
professional
than the VideoMaster Splitter, even though the Videomaster cart is
actually better than
Vidi ST.

However, I think you can use either splitter with either cartridge.
That's something I will explore more on in the future.

(Have a Ton of Projects at the Moment)

I have even used a Videomaster splitter with a Expose' Main Board
Digitser on the
Falcon.

I also have the Vidi ST 12 Cart that has the built in Splitter and does
4096 Colors.
It is a 12 Bit Cartridge.
It works on a ST/STe or Falcon and does much better Color Grabs/Video
than the
older Vidi ST.

I was just wondering if the older Vidi ST cartridges had any known PCB
board upgrades?

The 2 Vidi ST carts I have are both black, but the size and shape are
different, but the
basic software that came with them are about the same version. One is
1.29 and the
other is 1.29B according to the original disk labels.

I have noticed differences in PCB design in VideoMaster Falcon Carts.
But only after
taking off the cover. The Carts themselves all look the same.

> machine yet, can you run off the 030 and try it with the CT installed?

I've got Videomaster Falcon.

I've just finished playing around with it for awhile. I tried it with the CT60 on/off, motherboard mod on/off, under MINT, under TOS, booting up from the hard drive with all AUTO folder programs, ACCs, and CPXs disabled, and with fastload on/off, TT ram on/off, and TT prg on/off.

I also unplugged the DEKA interface and plugged in an original ST/Falcon keyboard. It made no difference either.

The program still runs, displays the menu screen perfectly, you can move the mouse anywhere you want, but it does not respond to any mouseclicks.

I have a question (since its been so long that I can't remember) - if the cartridge is not plugged in, or working, or doesn't have a video source actually coming into it, it doesn't matter right? The program itself should still run? Can you try yours and see?

Thanks much.

4483. Debian Sarge on a Hades - How I did it (Short ver)

Newsgroup: comp.sys.atari.st
Date: 2005-10-10 12:35:56 UTC
From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <434a8a66d5bfe0@comcast.net>
Source record: 10764

Hello All,

Well here is how it all came about. I still do not hav a desktop envronment, but I am working on it. Of course what I am about to say applies to a Hades, but I am sure it could apply to a Milan, Falcon or TT.

When I first tried to install Sarge, I had trouble from the beginnins just trying to get the ram installation disk to run. I am sure many of you have had the problem of the ram disk quiting saying things like corrupted or missing list. I could not get any farther until I read where the ramdisk and kernel work best when loaded into ST RAM. This is an "-R" in the boot agument. So my installation boot argument is this:

```
-d
-R
-V
-t
-S 200000000
-r cdrom/initrd22.gz
root=/dev/ram
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
load_ramdisk=1
ramdisk_size=13000
debian-installer/framebuffer=false
```

The -t tells the ramdisk to ignor the TT ram. Note the "-S". This statement does a let's pretend we have this much ST ram. I would imagine all your TT and Falcon owners could do this, but when I split my Ram into ST and TT ram, I have 14meg of ST ram and about 240meg of TT ram. If I leave the -S statement out, the ramdisk still loads because of the -R command, but when it comes to loading and mounting CD disk#1, it stops about 1/2 the way through. You need the -S statement at least I need it. Oh, I forgot to mention I bought the 13 disk CD set for M68k computers.

The video=external... is needed because I have a PCI graphics card.

Of course to boot the Linix partition I use the following if I have split my ram:

```
-k vmlinux
-t
-S 240000000
root=/dev/sda2
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
```

I use this if I have split not split my Ram (all ST ram)

```
-d
-k vmlinux
-t
-S 200000000
-T 200000000
root=/dev/sda2
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
```

It seem things work best if the kernel/ram think you have both kinds of ram. This first time I installed Sarge, I tried to boot the Linux partition using the boot argument without the -T statment in a non-split ram environment and the boot failed and I could not recover, so I just re-installed it again.

Remember, if you split your ram and use the -S statement, you still will only have 14meg of ram to go with. I like the non-split RAM and the -T and -S statements used. This way I know I have enough memory. Oh, notice in the boot argument example the -S statement in lower then the one in the first example. This is because when I set it high in a non-split ram environment, the ram disk crashed like before. If you sucessfully install Sarge and want to change your argument, test it out with the installation ram disk first. If you can get by the reading/mounting of the first CD Rom (must get to 100%), then things will work on the booting of the linux partition.

Two last things to say. In the installation process you will get to areas where you are asked to select things like in the base configuration you are asked to choose packages to install. Use the arrows keys to scroll up or down and use the space bar to select. When you are done, hit Control-i and the cursor will go down to the "OK". Then just hit return. Use the Control-i if hitting the return button does not work .

The other thing is that sometimes at the start, the fonts get screwed up when the ram disk loads. If this happens, reset the computer and run the booting of the ram disk again. Usually on the second or third try you will be able to read what is going on, but the edge fonts will be garbage. Do not worry, it will still work fine.

Well that's it. Try it and let me know what happens. I hope it works for all of you. Take care..

>Maybe, but why don't you use objc_draw?

For speed reasons. If one is to redraw a rectangular area, there is no need to adapt the image data to an icon mask. Hence, a VDI blit directly from a buffer will be (significantly) faster.

Again, does anyone have info on how MagiC handles this conversion? Is the data converted each time objc_draw() is issued, or is a device dependent format buffered somewhere?

>I think you should use a orignial TOS, if you make tests.

Ok then. The most current official TOS version available (the one built-into Falcon, unless I am mistaken) will also behave like Atari Compendium specifies.

That is, even old TOS 4.04 manages the conversion automatically upon rsrc_load().

Message-ID: <1128981945.355914.223370@g47g2000cwa.googlegroups.com>
Source record: 10765

I' m quite sure I bought a floppy extension cable from Cables To Go.
However, they don't seem to have it anymore.

I did find floppy extenders here:
http://www.grendonaudio.co.uk/acatalog/Online_Catalogue_Adaptors___Leads_21.html

Cables To Go will also make a custom cable, although I have no idea
what the cost is.

Galen

4489. Word Perfect on CT60 update

Newsgroup: comp.sys.atari.st
Date: 2005-10-10 22:13:20 UTC
From: Galen <atarigalen@yahoo.com>
Message-ID: <1128982400.004763.120860@g44g2000cwa.googlegroups.com>
Source record: 10766

I finally had a reason to go try WP on the CT60. Under 256 color and extended resolutions it doesn't work. (The same is true on a regular Falcon.) Under 16 color 640x480 it did indeed work with the CT60 and was VERY fast. There was some minor screen gibberish, but I seem to recall this happens occasionally on regular Falcons as well.

And knows his gigabytes from megabytes! I doubt if there is such a
creature as a 60 gigabyte MFM drive - they were much smaller in
those days, and even 60 MB was considered big for an Atari...

Okay, I found some more (non-Atari) info about the game by going to
the "Home Of The Underdogs" website:

A "view-from-the-turret", Dreadnoughts is an excellent World War I naval
simulation that offers an interesting, albeit very slow, portrayal of
tactics during the few World War I encounters. The game system was
interesting, albeit before its time in terms of computer hardware
capabilities. Designer Peter Turcan greatly improved the breathtaking
isometric battlefield engine used in his earlier Waterloo and modified it
to depict tactical naval combat. The result is a spectacular, unique naval
simulation whose beauty is more than skin deep, due to the inclusion of
realistic factors such as weather effects and more. Definitely a game
worth investigating for all armchair commanders, especially those (i.e.
most of us) whose hardware couldn't handle the game when it first came out
:)

By Peter Turcan 1992 Datasoft.

I distinctly remember reading a review of this game in one of the Atari
Euro-mags from yesteryear - it probably would have been either ST Format
or Atari World.

Anyone have this game and want to sell it?

Mike, don't do that. I have no idea how to help you fix it, but if nothing
else give it away for the cost of S&H to someone who might need it for
spare parts.

Atari hardware is getting to sparse on the ground to be throwing items
away - it breaks my heart to read these kinds of messages! :-(

See ya.

Hi, Ronald!

Have a look at this clone as well:

<http://home.tu-clausthal.de/student/iMaze/>

It appears to be closer to the "original" at least concerning the
graphics...

Regards,

Alexander

Sure does, doesn't it? I thought I'd mention as well, it looks like Imaze
is comepletely free/sourced, while SuperMaze looks like it has some
proprietary stuff in it. Just for those who are concerned about such
things. :-)

Thanks Alexander.

Great :)
I just got my memory for the ct60 so will see if it will fire up (i had
old memory from a pc but was no good) The header can be done..just one
question if i get the floppy extension is there any loss of signal to
the computer? I also need to see if i can still get the usb card from
nature..I may have missed my chance due to emergency repairs to a
crappy water heater line.. thanks for the help :)

Not for sure, but I seem to remember that there are two versions of
WordPerfect.

One didn't work well or at all on the Stock Falcon030, and the other
version ran just fine.

I picked up a Complete version 4.1 of WP lately. At least I think it was
4.1.

I already had a complete version that would not run on the stock Falcon.
Not sure what version it was.

Anyone know about this and what version does work correctly on the
Falcon?

SuperMaze uses a commercial game engine where source code publishing is
not possible.

By the way: The integrated maze editor is able to read all old
Midi-Maze 1 mazes! :-)

Thanks for the reply, Paolo.

Here is what I've got so far (on my keyboard):

SPACE - starts/stops play
* (<shift>8) - quits out of the program
- and + - will increase or decrease frequency from 20-50khz
/ - swaps out the master clock from 25mhz to 32mhz

Voices...unknown (to me) at this time. The screen for the app says:

'('/')' and I have no idea what that is supposed to mean. Its certainly
not "/", because that swaps out the master clock.

Thats the only one I don't understand.

Thanks.

Also worth noting, the SH205 is worth IMHO less due to the fact that it has an internal MFM/RLL controller and an MFM drive. You'll be hard pressed to find one of these drives to upgrade it with. The SH204 has a SCSI controller which could accept larger scsi drives - I say could because the Supra shoebox cases/controllers don't seem want to.

The SH205/Mega case however is IMHO the coolest case Atari has ever produced and would make a good candidate for a MiniITX ARAnyM box project.

Thanks,
Mark

Duh! <slapping self on head *hard*>

I took it as the "/" being enclosed in the parentheses, not the
parentheses being separated into right and left by the "/". Talk about not
being able to see the forest for the trees! :-)

Thanks Paolo! Gonna go try it out right now.

4527. Atari 1040ST and internal Floppy drive grounding problem?

Newsgroup: comp.sys.atari.st
Date: 2005-10-14 20:54:33 UTC
From: TJ <tjlazer@crapmail.com>
Message-ID: <11l06o8a4riav10@corp.supernews.com>
Source record: 10704
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am trying to resurect this Atari 1040ST I have. It worked but the video was really bad on a cold boot. Screen flipped and was unusable for about 10 minutes, then as it warmed up it got better but still was a bad video signal. I tried to get it working by reseating all chips etc and no go. I swapped all socketted chips and no go. I though, well I will just get another cheap system board! I did and both exibited a similar problem. On disk loading, each track load, or click from drive, would flip or jump the screen, but it was clear and crisp unlike original board. Also as unit warmed up from cold boot it would get less evident but still on disk loads the screen would flip or jump slightly. One thing I noticed is the drive standoffs were glued on the motherboard since the replacement boards did not have them on. The brass one was also glued on, does this need to be grounded to the board? ie no glue! I cannot see what the problem might be, I tried two different PS's.

Thanks

4529. Old Rumor regarding VMF cartridge

Newsgroup: comp.sys.atari.st
Date: 2005-10-15 01:51:09 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <sE84f.4184$6l.3566@bignews3.bellsouth.net>
Source record: 10709

I remember a Rumor regarding the VideoMaster Falcon Cartridge and
Software.

The Rumor was that a version was made that would Capture real Color
Video!

Now I don't know if it was a difference in the cartridge or software or
both.

But since the software does allow you to import Color pictures into the
Video,
save it and play it back.

It would seem that the current software does support color video.

If only the Cartridge would Capture Real Color Video or the software
would
allow it.

I wonder if the software was tweaked by someone who knows what there
doing
if one could get the cartridge as is to capture real color video?

It would be great to capture 256color video with the VMF Cartridge along
with the Sound as the cart does grab the sound along with the video
already.

Does anyone remember a Rumor similar to this regarding the
VideoMaster Falcon Cartridge?

My brother is auctioning off his collection of vintage computers and
related stuff. He asked me to post a link to the auction to a few
related newsgroups. Please feel free to take a look at the auction
below:

http://cgi.ebay.com/Classic-Vintage-PC-Computer-Collection-No-Reserve_W0QQitemZ8708420717Q

You may want to take some pictures that show the equipment...

Your brother really should take the equipment out of the locker and take
some photos of it.

4533. Re: Atari 1040ST and internal Floppy drive grounding problem?

Newsgroup: comp.sys.atari.st
Date: 2005-10-15 15:17:11 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <dir6hn$5mt$1@reader2.panix.com>
Source record: 10710
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Check power supply voltages, look for bulged or leaking capacitors,
replace same. Maybe two similar power supplies.

If there was any distortion, I would suggest changing C109 thru C113 from
470pf to 22pf. Some monitor cable capacitances are too high for the board
capacitances, and those two working together create screen distortion.

These caps are on the RGB and sync outputs. No, the supports for the disk
drive do not have to be grounded. They are just spacers.

TJ <tjlazer@crapmail.com> writes:

: I am trying to resurect this Atari 1040ST I have. It worked but the video
: was really bad on a cold boot. Screen flipped and was unusable for about 10
: minutes, then as it warmed up it got better but still was a bad video
: signal. I tried to get it working by reseating all chips etc and no go. I
: swapped all socketted chips and no go. I though, well I will just get
: another cheap system board! I did and both exibited a similar problem. On
: disk loading, each track load, or click from drive, would flip or jump the
: screen, but it was clear and crisp unlike original board. Also as unit
: warmed up from cold boot it would get less evident but still on disk loads
: the screen would flip or jump slightly. One thing I noticed is the drive
: standoffs were glued on the motherboard since the replacement boards did not
: have them on. The brass one was also glued on, does this need to be
: grounded to the board? ie no glue! I cannot see what the problem might be,
: I tried two different PS's.

: Thanks

You gotta be pretty lazy to auction off your entire collection with just
one photograph taken from a distance. You can't even see anything except
for ~ 5 pieces of equipment.
At least take a few pics from inside the locker. The guy obviously
doesn't care about getting market value for his items, as this auction
raises a big ol' red flag.
My prediction of final selling price: $112

Anyone else wanna make a guess?

I agree with the other posters, your brother needs more pictures to back up the descriptions, also pics of the misc cables, books and stuff.

(I'm glad my storage isn't that piled up... Though it is getting there...)

This is my collection. I would be willing to bet that none of you have ever had to acquire, store, pay for, protect and maintain a collection this large for five years. Looking at the picture do you believe that I have instant access to prime pieces to photograph them? Don't you already know what they all look like anyway? Do you think I am lying? Anybody can get pictures from somewhere else and claim that they are their machines. If I was to post a couple of pictures of Macintoshes and cables and would you feel better? I can't take pictures inside the locker because I can't get into the locker. It's too full! And it doesn't make sense for me to start ripping packages open (as you would know if you read the whole eBay description) because as they sit now they are protected. It is just not feasible (due to the fact the stuff stacked almost ten feet high ten feet deep, the primary purpose of the photograph which is also explained in the description) to start tearing the place apart looking for a needle in a haystack. As the description says I am not selling anything super rare. If you know anything at all about vintage computers you should be very familiar with what I have listed and shouldn't need to see a picture, if you do there is plenty of that kind of stuff on the Internet. If you want to come see it in person by all means I will show it to you. I am protecting these computers as best I can. As the collection grew I was forced to rent a storage locker, as I was not considering selling the collection I did not take into account that I should pack it in any other manner other than the most space efficient and protective. Considering the circumstances this is the best I can do. It's easy to be critical. If you have the practical experience and you could do better by all means let me know.

The problem is, we have to take your word for it. What I see in the picture is a big pile of boxes and plastic bags. I see in Apple II wedged in next to the bicycle, and I think I can see two Apple II era monitors. We all know what it takes to store such items, but when it comes to buying something we need some assurances. This is clearly a huge pile of stuff, but I see nothing in the picture I want to own. Furthermore, you make no assurances regarding physical condition, or if any of it actually works. You even admit in the description that you don't know everything that you have stuffed in there.

You probably will not get a bid anywhere near the market value of all this stuff, because your buyers cannot get a clear idea of what you have for sale. Besides, if you really want to get top dollar for this, break it up into bundles. Hell, you could probably get enough for the Apple II and the two monitors (assuming they work and you clean them up real nice) by themselves to pay for another month's rent on the storage unit, which would in turn allow you to dig into the first layer of boxes and put together a few more bundles. It's a huge job, but I think you'd be happy with the extra cash. That is, unless everything is in such bad condition (or simply non-working) that such close scrutiny by your bidders would be counter productive.

Dude, most of us here are just trying to be helpful, sure it's critisim
but no one here (except for one poster) thinks your auction is bogus.
Just that we could see you could do better if you had a better
presentation is all.

I wish you luck on the auction, certainly it's a lot of cool stuff you
have listed.

Sure I know what most of the items you list in your auction look like,
but without pictures how can I know what condition they are in? I
would pay alot for mint condition Atari 800xl's and Apple II's but
hardly anything if they are in poor condition.

Surely bidders are going to consider the "Sight Unseen" factor,
and the "work involved" factor as well, but, the "what-if" part
is intriguing, even to me, but I'm in PA so this is out of the
question for me entirely anyway. Had I been in the local area and
possess the space to store this stuff, I'd consider bidding and
should the list even remotely describe what "is" there, it truly
could be the Gold Mine that is being offered. The person who is
auctioning off this stuff, however, is inveritibly, "The Loser".
Broken down and sold in separate lots surely would bring loads
of cash, but this way, it is just a garage sale at best. :o)

As a collector (of a quite a large amount of vintage computers and game systems) I think its 'BLASPHEMY' to treat your collection like this and just stack and pile it to the ceiling with no rhyme or reason!

One has no respect at all if they treat their prized collection like this.

Still would be cool to go through... feel sorry for whats on the bottom though (sigh)

I wish I had that much money where I could just not care and sell everything in one huge pile on eBay. People don't realise if took the type and tested and took photos of everything that one could make a killing on eBay instead of a bulk deal for stuff.

I will cherish that photo though thats funny but sad give the collection to me... I will air it out and add it my 'shrine' of gaming.

VastFear

I was a compulsive hoarder, I bought most everything I came into
contact with thinking it was going to be valuable/needed/useful
someday. I (foolishly) envisioned that I could save this stuff until I
retired and then it would be the basis for a hobby. I rarely if ever
tested what I bought; I figured I would do that as my hobby. If
something didn't work I would (and do) have multiple examples from
which I could get parts. I assume most of the stuff I bought worked; I
have no reason to believe it doesn't. I assume some of the stuff has
problems. The collection is obviously being sold as is, like I said if
something doesn't work there is a good chance there is another
example that does. There is a reason I am selling it the way I am, I do
not have the time or the resources to break the collection down and
sell it bit by bit over eBay - THERE IS TOO MUCH! If I don't get a
reasonable offer I will donate the majority for a tax write-off and
keep only the cream of the crop. A lot of people seem to be taking this
personally. Don't, it doesn't involve you. This auction is not for
everyone. It takes a large commitment (I pay $100 dollars a month to
store it) and most people will not be in a position to handle it. As
far as having to take my word for it, I imagine you've noticed
that's how eBay works; a lot of it is on faith. Once again (If you
read the full description) you'll notice I referenced my feedback
(much of it gained from buying stuff in the collection), it is
impeccable. Tomorrow I will go out there and rip some packages open and
take some pictures, I don't think this is really going to give much
insight into the vast majority of the collection, but it's what the
people want. Please know that I do appreciate the constructive
criticism, it's the ignorant blowhards I could do without.

Um, does this mean you plan to renig on your auction if you don't like the
final price? You did not set a reserve.

You listed with no reserve and you have a bid - you don't get to keep or
donate anything.

>..... my feedback (much of it gained from buying stuff in the collection), it is
> impeccable.

won't be for long if you reneg on your auction.

Oh so now you will decide depending on the winning bid what the person
gets? This doesnt sound right at all. Personally I would stay away
from your auction.

I am not legally obligated to give away for next to nothing something I
have thousands of dollars and years of effort sunk into. If I was to
end my auction early (emphasis on my, it's meant to serve my purposes,
I'm the paying customer), I would be well within eBays rules
(http://pages.ebay.com/help/sell/policies.html). They are only
concerned with "Chronically" ending items early. If I were to do
it, it would be the first time ever. S:-)

This is directly from eBay seller policies.

Ending Your Listing Early

Sometimes something goes wrong and you can't complete your listing as planned. If needed, you can choose to end your listing before the scheduled date. If there are bids on your item, you can cancel them.

Reasons for ending listings early include:
Note: Your account will still be charged listing fees (such as the Insertion Fee) if you end your listing early. Consider revising your listing first if there are aspects of it you want to change or improve.

a.. The item is no longer available for sale.
b.. There was an error in the starting price or reserve amount.
c.. There was an error in the listing.
d.. The item was lost or broken.
Timing Matters
When there are 12 hours or fewer remaining and the item has a winning bid, including a reserve met bid, sellers may not make any changes to the listing, including:
a.. ending the item early. Sellers may cancel bids, but not end the item unless the item is being sold to the high bidder
b.. adding to or changing the item description
c.. converting the item to pre-approved bidder
Canceling bids or making changes to a listing with bids when there are 12 hours or fewer remaining damages the buyer experience and can undermine trust in the marketplace.
To end your listing early, follow these steps:

1.. Type your item number into the End My Listing Early form. (You can get this number on your listing, on your confirmation email, or on your My eBay page.)
2.. If there are bids on your item, choose between:
a. Cancel bids and end listing early
or
b. Sell item to high bidder(s) and end listing early
If your item has no bids, you'll skip this step.
3.. Choose the reason you're ending your listing early.
4.. Now your listing will end and will no longer be displayed on eBay. If there were bidders, they will be emailed that their bid was canceled and the listing ended early.
Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are

legitimate reasons for ending a listing early, abuse of this option will be investigated.

NO YOU NEED TO EITHER PUT A RESERVE OR SELL IT FOR WHATEVER THE FINAL
BID IS OR ELSE YOU ARE A CROOK.

Not according to what you posted:

/Note: Sellers are not permitted to cancel bids and end listings early in
order to avoid selling an item that did not meet the desired sale price.
This is considered to be reserve fee circumvention. Although there are
legitimate reasons for ending a listing early, abuse of this option will be
investigated./

That means that since the seller indicated in this thread that they
intend to end the auction early if they do not receive a "worthy" bid,
which implicitly is a circumvention of the reserve fee, thus an abuse of
the end-early option.

Actually, if you don't set a Reserve Price and you don't end the auction
early, you ARE legally obligated
to sell to the highest bidder. Just as making a bid constitutes a contract,
so does offering an item for sale.
If I were you, I'd end the auction early and re-list with a Reserve Price.
As it stands, if the winner of the current auction wanted to take the case
to court, you'd be on very shaky legal ground.

4557. LCD monitor interlaced mode with Crazy Dots?

Newsgroup: comp.sys.atari.st
Date: 2005-10-16 11:09:47 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <435242f813edcc0@tripnet.se>
Source record: 10734

Does anyone know if it's possible o run a flatscsreen (LCD) monitor in interlaced mode? (My own guess is no...)

I'm trying to find a way to drive a 19" 1280*1024 monitor in monochrome with a Crazy Dots card on a TT but I think I would need a too high dotfrequncy to get the desired resolution in non interlaced mode?

Which is the latest working VMG-4000.PRG ?

I have tried the 1.12 version from:

http://www.ping.be/~pin10575/CRAZYD-E.HTM

but it does not seem to work with neither the Crazy Dots or another Spektrum I card. When testing an existing good resolution the monitor goes out of sync. If I try the older 1.8 (supplied with NVDI5) everything is fine.

The HISTORY.TXT in v. 1.12 reads:

V1.12
Spezielle Mega4000 Version IO16,W32 only. :-/

Maybe that's the reason it doesn't work on my setup?

On:

http://www.wrsonline.de/backscan.html

VMG-4000 1.15 is said to be the latest version! Any source for that version? Maybe the author Andreas Winter still can be reached somehow?

Read, it says "DESIRED SALE PRICE" and "RESERVE FEE CIRCUMVENTION".
This applies to auctions with a reserve fee set. He has none set.

> That means that since the seller indicated in this thread that they intend

Here you eat your own words, where you repeat the same terms,
"CIRCUMVENTION", and "RESERVE FEE".

He may end his auction at any time before the 12 hour to end limit.
You pulled your data out of context, and I've been a seller on eBay
for quite a while, so read up.

4559. LARGEST HOME COMPUTER COLLECTION IN THE WORLD (?) FOR SALE

Newsgroup: comp.sys.atari.st
Date: 2005-10-16 12:04:34 UTC
From: "Dimitri Kokken (info@fki.be)" <dimitri.kokken@pandora.be>
Message-ID: <wkr4f.186118$HN5.48581@biebel.telenet-ops.be>
Source record: 10736

Hi there,

I am selling my complete collection of computers (over 570 different ones).
If you are interested in some computer(s) from my collection, just mail me
at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you to
the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS MESSAGE
PLEASE!

In max. 2 weeks time I will start a mailing list and everyone will be able
to bid on SEPARATE computers.The exact procedure of the sale will then also
be explained

So...please don't mail me saying : I am interested in X and I want to know
how much you want for it as I don't have prices set.

As you can see from my 100% positive feedback on Ebay (member ChaosDM)
this is not a scam, but a serious sale. I don't want to go through Ebay
directly, because listing 570 different items
separately would take AGES!

Anyway...the list of the collection can be seen here :
http://users.pandora.be/F-242/Computers.htm

There are a LOT of very and ULTRA rare items in there

For example :

A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
A LOT OF ARABIC MSx's
A LOT OF RUSSIAN COMPUTERS
ETC...

Cheers,
Dimitri Kokken
Belgium

I too have been a seller on eBay for quite a while, and I feel my
interpretation is correct. The term "reserve fee circumvention" means
he did not use a reserve, thus circumventing the reserve fee that eBay
charges. The policy stated is their to protect eBay's fee structure,
not the seller nor the buyer.

Please read ALL of the policies on ending early, not just
the areas you need to argue with me. It says, should the
seller end early, the eBay listing fees will still apply.

'Nuff said, say n'more, nudge-nudge, know what I mean?

End of discussion, because I know what I'm talking about.

I'm intrigued as well and in Philadelphia. Maybe we should make a drive?
I definitely do NOT have the space right now, but I plan to buy a house
within a year which will have a suitable basement for this pile ;) I
worry about renting a truck and getting there and it just being completely
worthless junk. I think we all know some collections are like magic,
others are a pile of half broken 520ST's. I'd pay more for a single
clean falcon than 15 dirty 520's. That's why the contents matters to me,
and while this is intriguing enough to look at, I won't make the drive on
that description alone.

Thanks,
Mark

Doh!

Nevermind, the collection is in Portland. I thought Massachusetts for
some reason. My ownership of this collection is now completely out of the
question ;)

Thanks,
Mark

This is the correct interpretation- if you end your auction early by
cancelling all the bids and ending it, you essentially created a reserve
auction without paying for it. That is what eBay doesn't want because
it damages the marketplace. Nobody will bid on things if they knew the
carpet will just be pulled out if it looks like they are going to get a
good deal.

If you want more money for your good, then set the reserve, or else just
set the minimum bid amount for the least amount you would take for it.
If you put it up for a dollar and later pull the auction, you are a
jerk and I would report you if you did it.

Ebay has a lot of screwed up rules that they continue to use that make
no sense, and really this is still actually too easy to do- you should
not be able to end your auction *at all* in my opinion.

Pete

I'm not arguing with you. It says you can end any auction
outside the 12 hour limit, by choosing one of 4 options
for doing so, but you still pay the listing fees for the
auction type you chose. Difference is with a reserve price,
if it ends naturally you can still choose NOT to sell to
any of the bidders. Now go away. Thank you.

What was discussed here is clearly mentioned in the rules as "Reserve Fee Circumvention" and is a reason to report the seller. I don't understand how it could be more clear.

http://pages.ebay.com/help/policies/listing-circumventing.html

It actually calls it "Reserve Fee Avoidance", not Circumvention, but
same thing.

-snip-

Reserve Fee Avoidance - Canceling bids and ending a listing early
because the seller's desired price has not been met.

Hey loser, listen closely.

If I set up an auction, I can decide not to have a "reserve". This saves me some money, as adding a reserve costs me a little more to list.

So I list with no reserve. However, I'd quite like to get about £100 for this item. With one hour to go, the bidding is at £50 and has been static for a while. I'm not going to get what I had hoped for this item.

So I cancel the auction.

This is exactly what would happen if I *had* set a reserve, but because I did not set one then Ebay loses out on that small amount of extra cash they would have charged me. This way, I get an auction that works the same way as a reserve, but without paying.

Ebay doesn't like that, so it's against the rules.

Oh, I forgot to add five exclamation marks, but I think you get the point.

D.

You argued your own point, so clearly you don't understand the whole concept of this at all. He didn't pay the reserve fee, so he IS "avoiding" it. You pay an extra reserve fee when you list your item, so it's a little more expensive to do so. If you end your auction early because you don't like what it's selling for (which is a selling offense you can be reported for) then you just created a situation that has the same outcome as the reserve auction, BUT YOU DIDN'T PAY THE FEE!

Pete

YOU don't get it. You have to end outside of a 12 hour limit.
There is no ending any auction within this 12 hour time-frame.
Read the whole thing, not just the part you want to argue with
me about.

Bill Garber

Yes I agree 100% this guy is playing around a bit with the rules and
he admits he doesnt even know what stuff works and what doesnt, it's
probably mostly in pretty poor shape, and even if you won the auction
would you trust this guy not to take the best stuff out before you
came to pick it up? I know I wouldnt.

I dont think he is gonna have much luck.

Haha. Read this again, slowly. You should stop, Bill. You're not only
showing that you don't understand eBay rules, you're starting to look like
an idiot, too.

The last 12 hours has NOTHING to do with this discussion. You can't end
an auction for the reason this whole thread is about, last 12 hours or not.

Again, from their Policies:
```

"Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are legitimate reasons for ending a listing early, abuse of this option will be investigated."

I mean, damn. What is your eBay user id?

The fact is that one of the options is "The item is no longer for sale".
This is broad enough to cover 'because the seller fears they will not
get what they wanted for it'.
A seller can decide to not sell their item FOR ANY REASON. Therefore, if
they decide the item is no longer for sale because they fear it will not
fetch an amount they want, then that is their right (as long as it's not
12hrs before the end).

MrBiggles <mrbiggles909@yahoo.com>:
>The fact is that one of the options is "The item is no longer for sale".
>This is broad enough to cover 'because the seller fears they will not
>get what they wanted for it'.
>A seller can decide to not sell their item FOR ANY REASON. Therefore, if
>they decide the item is no longer for sale because they fear it will not
>fetch an amount they want, then that is their right (as long as it's not
>12hrs before the end).

That particular reason is expressly forbidden by the eBay policy. I also think that its highly dishonest, no matter what kind of auction you are running.

Personally, I would never do it.

Perhaps it's better, if you are contemplating ending an auction early for dishonest reasons such as not getting enough money for the items, that you don't post about it on public newsgroups first.

What about if your dog pisses on the item after it's listed? How about
if you legitimately lose the item (some people are really that
disorganized).

You don't know what you're talking about. At Pete posted earlier, ebay's
policies specifically forbid ending an auction early because it isn't
reaching the price expected. That's why they have reserve pricing.

Whether you can lie and end the auction for some other, bogus reason is
beside the point. Please tell us your ebay id so we can all never buy
anything from you.

Don't buy anything from any of these crooks. Bill post your ebay ID so
we know who to avoid.

My philosophy on Ebay is that I love getting good deals, and if someone
gets a good deal from me, I love giving good deals, too.

I have gotten some REAL great deals off Ebay, no doubt about it, and I
was really happy about it. And I know that when someone gets a good
deal from me that it is really making thier day, and that makes me
kinda happy as well to be able to provide that experience to someone.

Somebody who is only concerned with what they can get out of the deal
and not concerned at all about the time and effort of thier customers
is not someone I want to deal with: there are plenty of ebay sellers
who follow through no matter what - it is the sellers who need
customers, NOT the other way around. I'd have more respect for these
guys if they'd just decide how much they want and put a "buy it now" up
on it, or put in in an ebay store.

I did - that's why I decided you would benefit from being corrected. Arguing with you doesn't come into it - others are doing that, and making a far bigger fool of you than I would be inclined to.

Is your opinion of yourself so great that you feel the need to call everyone who disagrees with you "losers"? And when someone responds in kind, then the rules change for them but not for you?

Very poor.

D.

I have to agree with Dr. Smith here, (believe it or not), but he's dead
on (IMHO).

If you want $X.XX for it, than set a reserve. If you simply end it
early because you aren't happy with the price, then you are dishonest
and should be avoided.

It's against the rules... Period... It's fraud. The principle of the auction system is the gamble. The seller makes a gamble on the final price. That's the fun of it. That's WHY ebay is popular!!! And it's CLEARLY against their rules. You can end an auction early because your dog pissed on the item or because you shot at it with a 9mm in a drunken fit of rage... not because you don't like the way the $$$ are going.

Give it up...

Mark

I notice a lot of people don't like Reserve auctions.... I seen pinball machines end at $150 with Reserve that you know are worth $600+ people just kinda blow them off. I certainly would be scared starting at $9.99 though (laughs).

I always start my auctions with bottom line of what I would like to get at least what I paid for it.

And always try to be reasonable on shipping too... and I 'clean' everything!

The 'biggest' thing though is I take the time to take photos and be honest with condition... that dude could make a killing if he took a couple weeks off work and sorted through everything, clean it up and test it all.

Hmm let's see... make $200 on it (he will end it early for sure) or make $2000 on it by putting some effort into it.

I dunno I kinda like making money (shrugs)

Oh ok sure... oh, wait... maybe not.

One of the legitimate reasons for ending an auction is "The item is no longer for sale". The reason it is no longer for sale can be anything, INCLUDING the possibility that it may not reach the seller's desired target sale price. If I wanted to I could end an auction early because I stubbed my toe, or wasted time explaining something to a dufus on usenet. That is the key here... a seller can decide that an item is no longer for sale FOR ANY REASON (as long as it's not in the last 12 hr window).

not necessarily, you dont know the condition of the computers (Im
guessing they arent in the best shape judging by how they are stored)
by his own admission he's never tried most (if not all) of them, so
many of t hem are prob just garbage and virtually worthless. Also it
sound's like if you get a good deal he will prob take the best ones
and keep them for himself (or sell/donate them elsewhere) and leave
you with the junk.

It's definetly a gamble bidding on this auction.

> HE DOES NOT HAVE A
> RESERVE PRICE SET, SO, HOW CAN HE AVOID A RESERVE FEE IN THE
> FIRST PLACE!!!!!

As others have noted, It's called a "Reserve Fee Avoidance" violation because the seller did not set a reserve (and thus did not pay the extra fee), but ended up treating the auction like a reserve auction. I see where it can be misunderstood to only apply if he was running a reserve auction, but it applies to non-reserve auctions. There is no need to end an auction early for reserve auctions, because either the price is met, or it is not. (Well, there is, if you state you are listing the item locally, and it sells before the uaction ends, but you wouldn't end the auction because you did not get the price you wanted, because that's the definition of a reserve price)

> YOU don't get it. You have to end outside of a 12 hour limit.
> There is no ending any auction within this 12 hour time-frame.
> Read the whole thing, not just the part you want to argue with
> me about.

I read the whole thing....

Actually, you CAN end the auction within the 12 hour mark. You can technically end the auction 1 second before the deadline. You just can't do it chronically.

Nonetheless, there is a huge difference between what eBay rules allow and being a good seller.

The seller has already note that if he does not get a "fair" price for the non-reserve auction, he will end it early. Technically, eBay will let him do it, unless someone complains to them about the auction.

I see a problem with the rules in this area, as the first mention of the rule states it can never be done, but right below, it gives the seller 11 times to do without incurring any investigation. It's hard to know which is correct. In any case, given how popular eBay is and the fact I see infractions committed on listings all the time, I'd say the seller will have no issues from eBay.

That said, I think the seller is acting in bad faith. Regardless of the rules of eBay, no one wants to bid on a non-reserve auction, only to see it cancelled at the last minute.

Do you believe the seller is acting in good faith by noting he will yank
the auction if he doesn't get a certain amount? It seems strange to so
actively defend the original sellers abuse of the eBay rules, as they
are written.

Source record: 10678

Hi,

Looking for the top part of a Falcon case. Anyone
got a spare for sale? I have the rest of the Falcon
but for some reason the top was discarded.

Thanks

Rob.

From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <4353ca4c224a60@comcast.net>
Source record: 10680

Hello,

Is there a program that will format a MintNet parition so it will correctly accept MintNet files that I can run from a Magic,Mint,Tos, etc desktop? I backed up my MintNet partition and do not want to go through the whole installation of Mint using EasyMint.

4603. Atari 1040 Available

Okay, forgot to give you all a list of the parts: here you go:

Falcon PSU (clean, excellent working condition)
Falcon Keyboard (clean, excellent working condition)
Atari Mouse (new condition, never used)
All the shielding from the Falcon's case(plus the speaker :-))

Thanks everybody

Theres no such thing as a Mintnet partition.
But there is a way to format a MiNT partition, if that is what you're
asking.

Coda.

Well, maybe. The EasyMiNT distribution includes a MKFS.TTP program, which
will write a ext2 file system. If that is what you want, there is a way,
it will not be recognized by TOS, and I know nothing about Magic.

One can run MiNT without starting MiNTnet, and have a TOS desktop and
access to a ext2 partition. Is that what you had in mind.

Jim

Well, how about TeraDesk? Although it has the same behaviour it is as
far as I know the only desktop that is still in active development.

And by the way, due to the fact that it is the only desktop that can
handle very long filenames correctly I recently switched to it. In the
beginning I missed some features but in the meantime I start getting
used to it.

Regards,

Frank

Hi again, Ronald!

I think that Thomas is still active and have plans to continue work on
Thing, but I also know that he is very busy elsewhere. So I have no idea
when we will see a new Thing version. Thomas, if you read, can you say
something about Thing development status?

Best Regards,
Odd Skancke

The problem isnt the icons themselves, it is how the icon banners are
rendered. So it doesnt matter what you do to the icons, really :)

Hello,

I read in a post a few days ago that there seems to exist a version of
thing > 1.27. Where can one get this version ?
BTW, I sent many mails to the authors of 1.27 in order to register a
long time ago, but never got any answer :-(

Regards,

Jean-Luc

4632. PeST on eBay

Newsgroup: comp.sys.atari.st
Date: 2005-10-19 19:41:58 UTC
From: techie_alison <techie_alison@yahoo.com>
Message-ID: <dj67i6$259$1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 10559

Hello,

Have seen a few names from here pop up in my inbox over the last few weeks.
Thanks for supporting
the project :-) From what I'm hearing back it's all good. There's now
about 50+ of them out there.

For anyone that's interested in one of these PS2 mouse interfaces, they're
up on eBay here;
<http://cgi.ebay.co.uk/Atari-ST-PeST-PS2-Mouse-Interface_W0QQitemZ8710374530
>

I have the PCB's to make about 12 more before Chris/Exxos and I make the
decision to buy
another 100 boards depending on how the figures look.

Further details here;
http://www.retro.dial.pipex.com/pest/index.htm

Thanks again,

techie_a

> I have the PCB's to make about 12 more before Chris/Exxos and I make the
> decision to buy
> another 100 boards depending on how the figures look.

I have 3 modules left here then thats all my stock out, problem is to buy stuff in packs of 25 to get good prices... problem is also there ain't 25 PCB's left. I can get some more made up again, though I have to sell 20 modules just to get back the cash invested on the PCB's alone... This is why the prices are going up at the moment and only buying in bulk packs is the cheapest solution.

http://www.cps-electronics.co.uk/web/PeST.htm

There are still a lot of PeST for sale, so I suggest if people want them to grab them while we have stocks of them. After they are gone we could go back to taking pre-orders though there will have to be at least 25 orders before the production goes ahead. either that or someone buys a bulk pack of 25, in which case it covers the costs of parts and don't leave me out of pocket then!

We know there are people in the states who can't get payment to use, We asked BEST if they would be interested in being a distributor and it was a no-go. Only thing we can suggest is if someone in the states buys a bulk pack and we can list them as a USA distributor for those who cant get payment overseas... It would be wise for "whoever" to get a list of people who wish to order one in effect taking pre-orders as I did last month before making the purchase. Its a lot of $$$ to invest in stock, though I am sure they will sell eventually. Its if anyone has a deep enough pocket to be a USA distributor!

We don't plan on pulling the plug on them anytime soon, we hope to keep them in production for a long time yet, but we have to be carefull that we don't end up out of pocket which is what happens when 100 people say they want one and only a handfull actually buy one, so I hope people can understand we are trying to be as fair as we can!

/end rant :-)

Chris

Seriously 1600X1200 photos?

That would take a day or 2 to load on dial up! :D

I still got a problem with someone that has an opportunity to find items
like that but have no respect other than stacking it on end and never
bothering with it again. (sniff)

Have you tried Jinnee? I know it's a bit expensive compared to other alternatives, but it is able to change the color of the text background under the icons, like you want to do. It's probably the most feature-packed desktop I've seen on our platform, too.

Someone else suggested making this a request for the Teradesk authors, if you don't mind the much trimmed-down features. That might be a way to go as well, since it's the most actively developed desktop around. Personally, I've tried Teradesk, and after getting used to Thing and Jinnee, it drives me crazy not having all those features. I don't think I could ever switch to it unless they decide to make a non-slimmed-down version of that desktop, which would go against the author's intent. Of course, memory limitations and functioning extremely close to the built-in GEM desktop isn't an issue for me (not too fond of the basic GEM desktop anyway), and I like having as many options available to me as possible. So for you, this might not be a problem.

Yes I have already bought one. I am using Mario Becroft's device on my Hades so I can use a serial mouse, but want the PeST just in case something goes wrong. I love my ST's, but the Atari mouse has not always been my favorite. Even on my STe I have Dexa Mouse that was converted by a friend of mine.

Everyone,

I have a carload of free ST stuff to give away.

STE1040, HD, two monitors, power supplys, books and software. Lots of software.

Can't see it thrown out - but my wife wants the garage back.

Deal is - you pay for shipping and you take it all.

I live in Calgary Alberta

Hello,

I'd like to buy an external working Atari hard drive in the UK, supplied with a 19DB cable. Size in megabytes not hugely important. Atari stock preferred although Supra, Triangle, Power Computing all good.

Offer is upto £50inc P+P. payable via PayPal.

Thanks,

techie_a

U should ask Thomas for 1.29 beta then. It was not released, but he was
happy to send a copy to registered users on request. Better (not perfect
still) long names support, image background in windows ... I use it, and im
quite happy with it.

Which I did numerous times. The last time I send a mail to Thomas was
maybe two months ago but alas for some reason he doesn't reply at all.

Hi Paul, Henk and Edward :-)

Good to hear that you're getting on well. Hope you've all tried holding
both mouse buttons for 10 seconds to try out the different scaling speeds.
A customer a few days ago was over the moon at the suggestion, I'm not quite
sure what happened to him after that.

Yayyyyy, the PeST club. Erm, well maybe not.

Friendly hellos,

techie_a

We try ;-)

Just trying to do all of the nitty searching for this project to begin with.

A TOS transparant ACSI <> IDE adapter, ooh yummy. for my tummy. well
something like that.. that just didn't sound right.

Maybe I am eccentric not to have a television, try it in the UK and see what
happens to you non-conformists out there.
http://www.marmalade.net/lime/

They REALLY (the BBC) do treat you like this in the UK. If you don't want
to watch adverts and the latest celebrities ad-nausea you're considered
strange.

waffle waffle

There are two 4.1 versions. (Yes, I know that doesn't make sense.)
You can tell the difference by the date on the splash screen. You want
April 18th, 1991.

I don't watch TV either, having the time would be a fine thing! I'm
actually happy listening to the local radio station, they get a lot of
E-mails from me during the day, entering the quizes with silly answers is
always a good laugh... I know im simple ;-)

I'm pretty sure that NeoDesk can use any font, but I don't think the background color can be changed.

Note however, that most fonts don't display well when in the tiny fontsize that an icon requires.

Hi,

To reiterate, I need a hard disk as specfied, as in an ACSI drive, not an internal fitted IDE drive or cartridge rom;

I'd like to buy an external working Atari hard drive in the UK, supplied with a 19DB cable. Size in megabytes not hugely important. Atari stock preferred although Supra, Triangle, Power Computing all good.

Offer is upto ?50inc P+P. payable via PayPal.

Thanks,

techie_a

Ronald,
He should be able to play MP3's with Aniplayer with no problem. I know before I did the MOBO mod my CPU load was around 10 percent playing MP3's now with the MOBO mod and a 97.5 mhz CPU I am down to 5 percent CPU load. This is playing a 128 kbit/sec MP3. Really the issue is here that older software was never designed for this type of speeder card. So far with apps I have encountered everything runs perfectly and VERY FAST. To me getting the speed is far more worth it than a few older apps or demos that decide not to work.

Just my 2 cents worth.

Thanks,
Carey C.

Hey Chris,
Whats up?? Just thought I would add that Rodolphe and Didier both I am sure did some extreme testing out of the bus speeder part of the CT60. If look at Didier's web page I think he is pushing 26 or 26.5 mhz out of his bus speeding which mean that the DSP and Videl are running at 52 or 53 mhz. Sure this is probably on the high end of the spectrum for all chips involved. But I am sure your not running 100% load on any of these components all of the time that the computer is on.

Agian just my 2 cents.

Thanks,

Source record: 10592

Hey gang. I was just wondering...doesn't the CT60 work with RGB (as in SC1224 monitors)?

Reason I'm asking is, I was playing with some older demos, seeing which ones still work and which ones don't. I was running at first with the CT60 turned *off*. Some demos work, some don't - so I can only assume its because of the motherboard mod thats done. Termfin runs, Beams runs, Hmm runs, but none of the Douglas Litte (of Black Scorpion fame) demos like Speeder work.

Anyways, I ran beams from ST low, no auto/acc/cpx stuff at all. It runs, and says it found no CT60, no Centurbo, no...well, you get the idea. It seems it detects some of these upgrades so I thought I'd boot up with the CT60 *on*, hooked up to an SC1224 monitor, in st-low, no auto/accs/cpxs and see what it would do.

Except that I can't even boot up. The screen goes garbled up color crazy and thats it. Nothing. Nada.

Am I missing (as per my usual practice <grin>) something obvious here? :-)

Thanks guys.

>>about Thing too...
>
>Well, how about TeraDesk?

TeraDesk simply the AES function rsrc_load() to read the icons file and then uses objc_draw()/_add()/_change()/_hide()... to draw and manipulate them. So the most elegant way to provide transparent icon labels would be that an AES somehow provide that capability. Alternative code might be created to provide enhanced rendering of the icons, e.g. like transparent labels, or proper drawing of 'disabled' icons (nice for for hidden files), but probably that would be more trouble than it would be useful. On the other hand, if someone wishes to contribute a piece of very small (up to a couple of hundred bytes) and fast piece of icon-rendering code (treating icons as progdef'd objects), it may get included in TeraDesk...

>as far as I know the only desktop that is still in active development.

A new release of TeraDesk (V3.63) can be expected in a couple of weeks or so- a number corrections has been made, some of which which may be considered more as improvements of the functionality of certain features. See new.txt on TeraDesk's home page.

>And by the way, due to the fact that it is the only desktop that can
>handle very long filenames correctly I recently switched to it.

I must admit that I do not understand this fascination with very long filenames ;) OK, the 8+3 of FAT filesystem is really very limiting, but extremely long names are boring to type, difficult to identify, and make directory listings almost unreadable. IMO about 10-20 characters should be enough- the useful content is supposed to be -in- the files, not in their names.

Btw. TeraDesk can handle filenames up to 128 characters long and complete paths can be up to 255 characters long, (but in some situations the complete path may be limited to about 130 characters).

Bbtw. it is possible to change maximum name/path length in TeraDesk by changing only three parameters in the source code- so a user should be able to easily recompile the program with this feature set to his liking (recently a user wished for filenames up to at least 1024 characers long...).

>In the beginning I missed some features but in the meantime I start getting
>used to it.

People have contacted me with very useful remarks about features which did not work as declared, or missing features which would be useful. Some of those suggestions have since been implemented in TeraDesk- so, if you have some specific objections, please let me know, and maybe something can be done about them.

Regards;

Djordje

Hi Chris. I had the Nemesis accelerator in my first Falcon. It was very compatible for me. All the demos, games, and apps that I used worked just fine.

Don't know whats different about the motherboard mod for the CT60 but it is. About 1/3 of the demos I've tried so far don't work (this is with the CT60 itself turned off). Some apps, such as Videomaster Falcon apparently as well. I can't even boot up with an SC1224 monitor with the CT60 on and the motherboard mods, although I can boot up with the CT60 turned off. Are the motherboard mods active all the time, even with the CT60 turned off?

Since you don't have the motherboard mod, can you tell me if you can play MP3s with the CT60 alone with Aniplayer? Just curious...

Thanks.

I never tried it before doing all the serious updating to my Falcon. I seem to be getting about what you are - just a little less. At 95mhz (100 craps out - haven't tried any of the odd speeds inbetween yet), Aniplayer reports about 10 percent usage. I'm perfectly happy with that. :-)

As far as the older apps go, I've no problem with except that I would like everything to work just like a stock Falcon - once I've got the CT60 turned off, etc, etc,.. So far, its really one single app that I used to use a lot back in the late 90's, and that was Videomaster Falcon. I can't get it to work at all on my current setup. I've tried the usual (setting program flags, booting up to ST lowres with no accs/auto/cpxs going) but its made no difference.

VMF worked fine for me with my first Falcon and a Nemesis accelerator so I had high hopes that it would work (at least) with the CT60 turned off on my current Falcon. Something is different though, as far as the modified chips/speeds go.

I think its down to video modes used, IMHO when the bus is running 20/25mhz some screen modes refuse to work correctly. I know half the apps I used didn't work so just gave up in the end.

I am pretty sure aniplayer works in CT60 mode, but I have never been able to solve my CT60 problems yet, I am lucky to get even to the desktop let alone running any apps. I'm waiting for the CTCM module, going to try underclocking the CT60 to like 40mhz and see if it runs more stable then... my falcon has been in bits for like 2 years now, even sent my falcon to rodolphe for testing and he said it works fine, I dont see how as I can't even get to the desktop without it crashing... ah well, old story now... hoping I can get some boost out of the CT60 so I can at least put the lid back on my falcon!

FWIW, I can't play a mp3 in 030 mode, not very well, CPU flatlines and mp3 starts stuttering, I think in CT60 mode it uses about 50%... really can't remember now, half given up tbh.

Chris

HI Carey,

Trying to remember the things I was using at the time and really can't, was like 10 years ago when nemesis came out ?! I know I played a lot of falcon demos which didn't work, though it was even simple things like depackers which would crash... its wasn't due to it being unstable, I could run programs all day long and it would run fine... some apps would work fine and others would just totally screw up... It didnt matter if you ran 20 or 25mhz even... All I can say is, from what I remember, that some video modes wouldn't work with the bus mods, it would be like the screen lost a sync or something... programming in 25mhz was fantastic! though with all the other apps which didn't work it just wasn't worth it..

I regret I dont have a clue on what the apps were now, was all a very long time ago, but as nice as 25mhz would be, its not something I would do again.. I know a lot of people (in the past) who killed thier falcon running it at 25mhz, so for me, at least, im staying well clear of bus modes.... saying that I can't get my CT60 to work correctly either... like I said to ronald just, I am waiting for mt CTCM so I can try underclocking the CT60 to 40mhz (if It goes down that low, I think so...) I would be happy just to get my falcon put back together and get on with archiving my floppy collection... would like some boost in speed to speed the whole process up tho.. I think the only thing to do is send my falcon back to rodolphe for testing again... though really can't see the point in doing that a second time :-(

Aniplayer is strange one, if you do manage to get as far as to load it up, you could play a mp3 for like a hour or something silly (yup same one looped) then move the mouse and it would crash... gem desktop would be like that too, I used 80col 16 colours for my desktop, half the time I don't even get that far (its not the acc's or auto programs either) in fact I posted some images of the crashes a while ago on here. All I was doing was doing a total clean boot and changing video modes from like ST low to ST med, etc, just doing that would crash... so still have no idea why it won't work....

actually I have a veloce STE, I think its running a 60020 at 30mhz, might just use that :-)

Cheers,
Chris

4676. CCAG Show Rescheduled Dec. 4, 2005

Newsgroup: comp.sys.atari.st
Date: 2005-10-22 14:34:22 UTC
From: fmh@copper.net
Message-ID: <435a4dee$1_2@newsfeed.slurp.net>
Source record: 10603

Show Rescheduled to

December 4, 2005!

As some of you may be aware, we are allowed the use of the National Guard Armory in Lorain, Ohio because one of our committee members is a member of the National Guard. This allows us to hold this event very inexpensively and free to vendors and attendees. In order for us to hold CCAG at the National Guard Armory in Lorain, he must attend the event. Unfortunately, Hurricane Rita activated the National Guard unit that he is in which meant he was unavailable for the now previously scheduled event date of October 22, 2005.

We have rescheduled the show to December 4, 2005, and have announced it via our email mailing lists and on this website.

4680. Misc Atari ST Items FS (USA)

Newsgroup: comp.sys.atari.st
Date: 2005-10-22 20:36:14 UTC
From: fmh@copper.net
Message-ID: <435aa2be_3@newsfeed.slurp.net>
Source record: 10608

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 10-08-05

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes! $50.00

Atari SC1224 Color Monitor. $25.00

Atari SM124 Mono Monitor. $25.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $20.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted
with no bad sectors. $5.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with
with no bad sectors. $5.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors. $5.00

SC 1224 monitor cover by Classic Covers. This is a brown cover
with the Fuji logo and underneath "Atari SC 1224 Color Monitor".
Perfect to protect your monitor from dust and have it look cool
too. $5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk $5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk $5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks. $5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks. $5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk. $4.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks $5.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks. $15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk $5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $25.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk. $3.00

Fuji Linux 3 CD-ROM set. This a full Debian 2.2r0 installation of
GNU/Linux for the Atari Computer. For more info go to
http://www.linux-m68k.org $10.00

Grammar Expert by Phil Comeau Software. Grammar Expert provides easy
access to the rules of English grammar. It also provides advice on
effective writing. Docs and disk $5.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk $5.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs $5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk $3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk $5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair
progarms that were infected. Manual and disk $5.00

WANTED

MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM DOS or Windows,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

Alison,

Are you after a collector's item, or merely a drive that will work
with an ST?

If the latter, you'd be better off with a SCSI drive and ICD link,
Link97 or similar.

> see czuba-tech for 32 MHz video modes problem sloving...

Is this the section you are referring to?

32MHz CLOCK for VIDEO modes ?
This clock is sent to the EXT pin of the VIDEL (pin #14). For RGB and
ST-Mono modes you need a new 32 MHz clock because the origin 32 MHz clock
will be now a 40 or 50 MHz. More, if you have a old NON-Multisync VGA
monitor, you will have some problems to set some extended video modes with
a 40 MHz and worst a 50 MHz clock. A 32 MHz clock is ideal for such old
VGA monitors. Locate the video chip 'VIDEL' (U34). Locate the pin #14,
counting to the left from the right back side. In front of this pin, there
is a metallic hole connected to this pin. With the tip of the utility
knife, scratch the varnish until you reach the metal, then tin it. Be
Careful with the videl. Solder a short cutted pin of a 33 ohms classic 1/4
W resistor (not furnished) into the right forward hole of the oscillator
U37 (see DSP picture above). Solder a single thin wire from the resistor
to the hole of the videl pin #14. This wire must be as short as possible
and above the motherboard. For this place the wire on forward border of
the floppy motherboard connector and fix it with adhesive. If you have the
gray ATARI VGA adaptor, the extended video VGA modes with the 32 MHz clock
on pin #14 won't be possible with this atari VGA adaptorout modifying this
adaptor (which is bugged !). You need to flip it and cut with the utility
knife into the plastic, a 1cm wide strip on the whole length and at 4mm of
the metallic border. After this you can access the inside, you separate
the pin 15 from the pins 11 and 19. Move aside the 2 wires connected to
pin 15, cut them as close as possible to the pin and connected them
together. If you don't want to do this hack, you can get 2 DB19 (male and
female) that you will solder (direct cabling) without connecting the pin
15 (cut them). This little adaptor will be inserted between the Falcon VGA
port and the gray ATARI VGA adaptor.

So are you and it saying that if you don't do this you can't do RGB with
the CT60 and the motherboard mod? That would maybe explain some things,
like why some software doesn't work.

Thank you.

Hi Rory,

Have just posted the following on;
http://www.atari-forum.com/viewtopic.php?p=52391#52391

Aly

"
rat tisa wrote:
Has anyone got an eiffel interface or can build one that I can buy from
them?

I particularly want to be able to use a PS2 keyboard on my STe.

Ello,

You sure can buy them, here; http://fujiman.no-ip.com/

The post appeared on comp.sys.atari.sys a while back. The guys' name is Rory
McMahon who purchased the bulk of remaining stock. His email addy is...
rorymcmahonNOSPAM@yahoo.com

There's a few things regarding Eiffel you need to be aware of;
*You'll need to dismantle your ST
*Once installed you then cannot use your existing keyboard or ports, Eiffel
is a replacement.

I've been approached to build a few of these but would definitely point
people in Rory's direction first as he's there with the thing.

Hope that helps,

Aly
"

Hi David,

Nope, definitely need an ACSI drive.

Not going to get very far in developing what I am any other way. ;-)

Sowwry, you're the third person to say, ooh have this or that. No, I
definitely want an ACSI drive, preferably a stock Atari.

There's hidden stuff in the way they behave which I need to find out, hence
why the STE's wouldn't work with non Atari drives. It's hidden responses in
the firmware on the host boards and I need to get a storage scope on the
thing.

<smiles>

What kind of hidden responses would that be? I cannot imagine that there
is something hidden that has not been published in Atari's ACSI/DMA
specification and is still not known untit today.

Er, I'm confused. I used an STe (TOS 1.62/2.06) with the 4 gig SCSI
Seagate drive that runs DarkForce now, for a long time. That was with the
ICD Link2 and no problems whatsoever.

Ello,

I haven't got a clue to be honest. It's just written in one of the ST User
magazines about the long list of STE incompatabilites. So wanted to check
it out.

Please, I just want an ACSI drive. :-)

Well, it's just as Ronald already mentioned: There is nothing special
with Atari's ACSI drives, and you can connect any stock SCSI drive to
the STE (with an ICD Link or LINK96/97). There are no incompatibilities.
If there were I would definitely know about them ;-).

> Please, I just want an ACSI drive. :-)

There are almost always some available on EBay.

It was included in Atari's developer documentations, but basically the
same information has also been published in third party literature years
ago.

Ello :-)

You're making me tempted to send you a long list of questions ;-) But I
thought I better not push it.

May I?

Really with this ACSI HDD I just want to iron out all possibilities in this
other development. This is practically how we did PeST too, by abusing it
in every way before shouting about it. Hence why I'm a bit cyptic
sometimes, as saying something fantastic is about to be done then going
quiet on it I hate doing. You know what I'm doing though ;-)

Ah eBay, HDDs bit pricey on there atm, and of unknown quality. eBay's been
a weird these last few months, not as much good hardware on there and
cowboys moving in. Last Atari metafile a few weeks back was £120 without a
19DB cable.

Hello Chris,
Hi how is it going??? Obviously not very good if you have had your
falcon down for almost 2 years. Hey I can offer my services. I have gotten
3 CT60's that have not worked or people said they would not work for them to
work. So I am offering my services to you if you want them. FREE of charge
just pay the S/H both ways. I enjoy working on this stuff and one friend
of mine in Minnasota USA had his torn down for that long and I got him up and
running in less than 30 minutes. Just ask Mark D. I was typing to him on AOL
while getting my friends computer going. If you do not want to ship it. Maybe
we can meet up on a video chat online or some sort of IM like ICQ, yahoo or AOL
I have them all so just let me know. I almost ended up with a CT60 once for
150 dollars because the person was so fed up with it. Unfortunately for me
I was able to help him. LOL. Let me know, I just really hate to see a good
speeder card just collecting dust. What kind of 68060 CPU do you have?? What
are you running the CPU at?? All CPX's installed in proper place?? What OS
are you using?? What is your hardware setup?? STram, Fastram brand and size??

There are lots of other questions I could ask and need to ask. Every single one
of these are very important. Lets get to the bottom of this so you can
once agian use your falcon but maybe at 60 or 66 mhz. maybe even 72 or higher
with the CTCM. E-mail me at f a l c o n 0 6 0(at)a d e l p h i a(dot)n e t

Just cram all of that together and replace the letters in parathesis with the
appropriate symbols

Thanks,
--
Carey Christenson

What is supposed to happen when you hold both mouse buttons for 10
seconds?

On my CT60, the mouse pointer just seemed to jiggle a bit.
Nonetheless, one could cycle through the resolutions well enough.

Galen

I'm just guessing, but I suspect Alison is interested in making
something that attaches to the ACSI port directly.

If you're doing what I think you're doing Alison, I hope you succeed.

CPU, erm, the full version I think... its running at 50mhz at the moment,
software does not matter, even a totally CLEAN boot fails most of the time,
fast ram is crucual 256mb CL2... maybe 128mb can't think offhand now..

> There are lots of other questions I could ask and need to ask. Every

still waiting for CTCM, wnat to try underclocking it more than anything atm.
Disabling the fast ram does appear to help but still far from perfect.

> Just cram all of that together and replace the letters in parathesis with

There is no such thing as an ACSI "DRIVE". There are ASCI to MFM/RLL interfaces (i.e. for non-SCSI drives) and ASCI to SCSI interfaces. Many of the original drives went had two interfaces an ASCI <=> SCSI and then a SCSI <=> MFM. I used to have one years ago. Can't remember who made it.. (Omnitech? I think.) I still have the ASCI <=> SCSI bit which is a BBDP interface but it now has a small capacity SCI drive on it.

As far as I know there is NO firmware in ASCI interfcaes. Keyboards are programable, but the ASCI interfcaes, no way. In fcat STE's don't always work with ATARI drives never mind third party drives. I think this issue is just a plain and simple noise/buffering/no parity problem. If mnemory serves me correctly the drives usually work fine until things start getting a little warm, when they start to corrupt the directory. In my case it would run for about 20 mins, when it would start too loose data from the drive. If this is undocumented commands/responses I'll eat my hat (genuine Panama of course). In fact there was a suggestion some where that if you improved the voltage regulation to the dodgy GAL it would (usually) work. I bet they didn't design it properley, ignored the noise margins, and then just didn't soak test the thing properly with enough machines. Atari seemed to work like that at the time, no sense of quality...

You might also want to check out

http://atari4ever.free.fr/hardware/drives.html

and look at the diagram there. I don't suppose it will work woth modern drives that need an initiator ID from the interface, but it might be a good starting point. I checked to see if its the same as my BBDP interface and its not. The BBDP interface has 15 LS Ic's on it,

2 x LS374
2 x LS240
1 x LS138
1 x LS280
1 x LS08
1 x LS132
1 x LS09
1 x LS04
2 x LS74
1 x LS54
2 x 7404 (yes not an LS version)

So not sure how you would hide any firmware in those :-) Its dated 1990 and works on all the machines I have tried it on , including an old MEGA ST (NOT STE), and standard STE and a TT032. As I said before I did have to have the GAL swapped in the STE but Atari did this without charge (except postage). Since I had the IDE interface popped into the STE I have used it mostly on Mega with an Seagate ST157N drive in it.

Dave.

Hello Dave,

You're gonna love this, one brilliant come back in the right place at the right time.. Perhaps..

Top side of the Mega STE ACSI host board;
http://www.retro.dial.pipex.com/acsi_ref/images/image1.jpg

Okies;

The 245A is an octal bi-directional switch (would have expected to see 2 of those if doubling up on pins)
http://www.maplin.co.uk/Media/product_pdfs/ub67.pdf

Those two marked ACSI and SCSI are GALS, so MCUs

The 374A's are octal flip flops
http://www.maplin.co.uk/Media/product_pdfs/ae28.pdf

I'm working out how these are used as am going to need some sort of method in what I'm trying to design, so as to cut down on main MCU I/O pin usage.

As for those hidden commands, there aren't any, it's that noisy I/O as you mentioned, have been reading up more through the magazines as time went by. Some of the HDD manufacturers at the time endorsed modifications to their kit involving cleaning caps etc. Well, saying that, Uwe has shed light on some (well 1, 0x1fH), which were used by the ICD/Link host interfaces to issue real SCSI commands through the ACSI port. The default ACSI addressable sector count is 2^21 * 512 bytes / 1Gb, these commands allowed this to be exceeded. Another mention has been made by ijor on another group that you can switch to 1024 byte sectors etc.

<smiles> and thanks,

Aly

ps. It's a FUJI Finepix S7000 btw..

It draws a box after 10-seconds and enters it's setup mode, where the left
mouse button cycles through the resolutions. It draws... right 100 pulses
to indicate mode 1, right then left = mode 2. right, left, right = mode 3.
right, left, right, left = mode 4. Pressing both buttons again draws the
box again, the one you saw when entering setup.

>just seemed to jiggle a bit.

Really???

@CHRIS@ You have a CT60 board?? ;-)

Hey Galen, is this causing you problems? You're getting on fine yes?
Please do let us know on this?

I'm sitting here just wondering what the CT60 would do to the keyboard MCU,
not alot I think. I think it's clock is internally generated and it
communicates with the main motherboard at a set baud rate.

Aly

I will try with with CT60, though as you can see from other threads its rare for me to even get to the desktop with CT60 ON... some of the hacks overclock the KB MCU, though ive not tried any of these hacks for a long time (one of my pet hates actually). The keyboard timeings will be faster if the MCU is overclocked, though I wouldn't expect it to effect pest in anyway. Would help if Galen said if he did MB mods or not.

VIDEL is receiving 3 clocks !
25 MHz fixed OSC for VGA modes
32 MHz bus mb clock for RGB/ST MONO modes.
EXT clock.

When you do not boost the MB, you don"y need to change something !
When you boost up to 16 MHz the mb, your 32 MHz clock will change. SURE, you replace the 32 MHz mb clock by a 40 or 50, so you get a 40 or 50 MHz on the VIDEL, so 32 becomes 40 or 50 ! So, the RGB & ST MONO modes cannot works because V & H sync have shifted !
It is WHY is an obligation to RE-inject a 32 MHz clock on the EXT clock input AND select the EXT clock input as the clock reference for RGB & ST MONO modes ! This selection is done by software (just a bit) and the CT60 BIOS test this at boot !

I'm laways issapointed to read such bad things !
If you sent me your mb + CT and I told you that it was running fine at me,
you can be sure it was running fine...
NOW, you should think what are the peripherals you do not sent me ?
Because there is a big chance that one of these (the HDD and the software on
it !) is the problem !

When I receive mb + CT to test, I connect them on MY PSU and my HDD that
contains a good version of HD Driver (7.60).
My HDD is a Quantum Fireball 3.2 GB.

Even if you do not boost the mb, you can get some HDD problem because of a
HDD timing problem himself or a software driver problem !!
Think to that : HD Driver may run fine on 100% of HDD models on a 030 CPU
and run on 95% of the HDD models with a so faster CPU like 060.
It is a timing problem (software timing, not hardware because MFP is the
same !).

Note that the mechanism introduced by ICD (also also used with the
LINK96/97) is not only relevant for addressing drives with a capacity of
more than 1 GB. Since *any* SCSI command can be sent this way it is also
useful (and even required in some cases) for other things.
HDDRIVER and other software using the SCSIDRV interface make heavy use
of being able to send any SCSI command on the ACSI bus.

I doubt that there is any switch for 1024 bytes per sector. What would
this switch be supposed to do? Any change in the sector size is useless
without software that can handle this. As far as hard disk drives are
concerned there are only a few that support other physical sector sizes
than 512 bytes.

The only other item is the HD, I use HD8, though like I said before, even if I unplug EVERYTHING and just change video modes in GEM a lot of the time it crashes also. This is just why I think very odd that I send you exactly what I am using and you say its fine but when I try it I get nothing but problems, the only thing which seems to help is to disable SDRAM, works much better but still lots of problems... there must be something stupid somewhere which is causing the problems.... but what.... I do not know....

i'm not saying CT60 or your work is bad, I think CT60 is a fantastic bit of kit. I wouldn't be trying to get it working if I thought it did not work!

PeST works fine on my CT60 Falcon, note I have not done the bus mods so can't comment, though I really doubt the bus mods will have any effect whatsoever on PeST's operation. If that were true a normal ST mouse would have problems aswell.

Let us know if you've succeeded to get in contact with Thomas. In the
past I've tried numerous times to get in touchs with Thomas but sofar
without any luck.

I really would like to get a copy of Thing 1.29. I even wouldn't mind
to pay for it.

Well, both the adresses I tried bounced back, once more. :-(
I feel perplexed, as I first tried with the one in the help file, and
now with the ones I found browsing the net, the same happens :-(
Could someone tell me what the actual current one is ?
Thanks,

Jean-Luc

4724. AtarICQ 0.165 is released

Newsgroup: comp.sys.atari.st
Date: 2005-10-25 21:52:56 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1130277176.602872.121450@g43g2000cwa.googlegroups.com>
Source record: 10451

Hi all,

This time the changes aren't that many, but I thought I better get a
new version released before I start changing things that will require
lots of time to finish :)

Go here to download the new version: http://www.ataricq.org

Recent changes:

* Added icons for 256 colour mode (Not all icons have 256 colour data)

* Changing online status can timeout now, if server is not responding.
AtarICQ interprets this as if we lost the connection.

* The keep_alive call is reimplemented, and sent to the icq server once
every 2 minutes. This may perhaps prevent aICQ from dropping the
connection.

* In preferences for contact list, you can now decide whether you wish
a selected contact to be indicated with
a dotted box or by inverting the nick.

Have fun.

Regards,

/Joakim

GALS are a pain. I some ways it woudl be better if there was firmware, as
there might be upgrades you could reverse engineer. With GALS if they blow
the verify link you have x-ray the little blighters to get any info.

Ah, I didn't know that you hadn't tested with a CT60. Mine runs at 66
- 95 Mhz with a 25 Mhz bus -- Czuba installed.

Anyhow, here's what happened (66/25 Mhz) -- note that I have a DEKA 2
interface, so this is a PEST to DEKA to CT60!

Upon plugging in -- mouse very sluggish, but works.

Upon holding down both buttons -- mouse pointer appears to jiggle
slightly, but nothing more.

Upon cycling through resolutions -- only the very fastest appears to
work well with my Kensington Mouse-in-a-Box, but at the fastest
resolution the mouse works quite nicely.

Note: Having very large hands, I actually don't mind the original
Atari mouse, so I plugged it back in and returned the Kensington to the
kid's iMac. I will pick up a mouse for myself once I find a nice one
-- I'm thinking of a trackball.

Galen

Sounds to me like your interface is to slow for the job. Seems like the deka interface isn't as fast as it should be for processing. I'm sure if enough people nagged alison enough she would develop a much better interface, but thats up to the Atari community not me :-)

Chris

ahhhh, some someone *DID* built that then ? I asked around for ages for
anyone who built that, I wasn't about to spend the time building one just on
the off chance, actually when I looked at it, I remember some of the logic
gates numbers were duplicated so thought thats not a good start either....
if it does work then I may make a pcb for it and pass it on to alison for
testing, im sure she could get all that logic compressed down a lot.

Cheers,
Chris

If you have the ICD Link 2, then I would get HDDriver. I have a Link2 in my
STe and HDDriver works great with it.

Well, we can see if its consistent in a few days. I've got the PeST
ordered, it should be here soon. I also have a Falcon CT60, running at
95mhz with the motherboard mod and a DEKA interface. I'll post results
just as soon as I can.

ICDs stuff is okay, but I'd heartily recommend Uwe Seimets' HDDriver
software. Its commercial, but worth every single penny. :-)

Nice :-)

Thanks to carey I have my CT60 pretty much running now :-) being using PeST
on my CT60 falcon for about 3 hours and was fantastic to use!

Myself and alison were talking about making a keyboard version aswell,
though we don't feel there is enough demand for them so its on the back
burner now.

Derrick, in order to test if your drive is recognized the demo version
(http://www.seimet.de/hddriver_english.html) of HDDRIVER is sufficient.
In case your drive is not recognized by the ID check of the HDDRUTIL
tool the drive may not be jumpered correctly, or is not correctly
terminaited, or it requires a SCSI feature called Initiator
Identification, which the ICD Link does not support.

ahhh, well, so it seems, there was a pile of stuff in a "MajiC" folder with
auto programs in which it seems were needed, I dont run majic anyways..
actaully didnt even know any auto loaders were needed at all! I know the
cpx's needed updating and of course I did all that... just never worked,
after booting up I couldn't even change res without it crashing, I had this
auto stuff in and changed res about 20 times with no problems, ran STzip for
about half a hour with no problems, so not managed to crash it yet... though
it was like 1AM when I was talking to Carey about it so not tried much
testing....

Seems there is a flash tool for updating TOS, can't get it to work tho,
saying the file is not a TOS image file, but it is! so not sure whats going
on there yet... not had chance to try again yet... been out most of today...

> > -- I'm thinking of a trackball.

The Logitech Marble Mouse trackballs are brilliant. :-)

http://cgi.ebay.co.uk/Logitech-Marble-Mouse_W0QQitemZ5821487863

You're unfortunately stuck with this DEKA arrangement though. I think I know what's going on...

PeST communicates with the ST's stock keyboard at just about the threshold limit to achieve the fast tracking. Then we pulled back a bit by about 20uS to build in an element of safety, but still, we're communicating ALOT faster than the original ST mouse does. I'm thinking that the DEKA was tested with a stock ST mouse and that PeST is too fast for it, this would also be a problem for the other high tracking replacement ST mice. Mmmm, if you're able to sell-on your PeST I could do one for you which is even slower (custom firmware) for the same price, but I can't guarantee that it'll solve the tracking speed without having a DEKA to perfect it on.

The beauty of this older hardware from a developers point of view is that everyones using the same keyboard MCU and Atari firmware, right from the basic ST through to the Falcon / TT. This DEKA arrangement is shifting towards the PC arena situation where manufacturers can't entirely predict their target market. I know it's common sense to say that PeST wasn't designed for anything other than the Atari keyboard, but that's just greedy company get-out speak and I don't like that approach to customers. I may be able to do a custom PeST for you if you're an obsessed Atarian but we'll need to find out the tolerances of DEKA. I'll put this on the faq in the next few days.

> >
>
> I'm sure if enough
> people nagged alison enough she would develop a much better interface, but
> thats up to the Atari community not me :-)
>
> Chris
>
>

We can't develop a better PS2 mouse interface without cutting corners and reducing robustness, we're at the limit of what can be achieved with the Atari's keyboard sub system. The bottleneck is the speed at which we can

communicate between PeST and Atari. There are so many PS2 packets being converted it almost goes beyond imagination, it's literally 1000's. If they're not all captured, and that means dud PS2 packets too, then we lose the 'feel' of the mouse. To give IBM and Microsoft their credits due, they've done a pretty good job as far as input devices go. Try loading up DOS 3.1 and your favourite retro game and you'll literally feel how far things have progressed.

I don't see any reason to build on Eiffel as that's someone else's project and they went through the struggles and repeatedly trying to break-the-thing too. There's pride in these things now, which is brilliant, it's why most of us are here?

In some ways we've hit lucky here as we're serving a market which isn't over saturated with money-grabbing-ba$t~d companies. Well I can think of two, one in the USA and one in the UK. They've only got to service a floppy disk drive and they've broken even that week.

Tired, need sleep.

Don't know how close it is to the original Atari mouse, but just for the
record I'm using a replacement mouse from Best Electronics.

So far, I've not encountered any problems with it and the DEKA interface.

As soon as my PeST gets here Alison, I'll test it and report back.

Thanks! :-)

They are slow - and they do things "bass ackwards" for sure. Example, 3
small towns close to where I live, Martin, Prestonsburg, and Pikeville.

In a row, it would be like Prestonsburg-> Martin-> Pikeville. Send a
letter from Prestonsburg to Martin, it goes to Pikeville first. I actually
had a Postmaster tell me that was how it worked. :-)

I don't know if there's any reason to make another version. The mouse
does work -- it's just not quite what you are describing.

Still, I wonder what occurs when you communicate at ST mouse speed.

Galen

Although SyQuest SCSI drives are old tech, I am new to them.
So, my understanding comes only from what I have been told.
I may be wrong about using "parallel." What I need to find out
is which SyQuest SCSI drives will work with a 1040ST with
4MB memory or a Mega 2. I now know from you that a SyQuest
EZ135 will work. Thanks much.

Oh, you threw me off when you asked about parallel. :-)

I've got both the EZ135 and EZ200. They both work just fine.

4750. Music Studio "Beackwalk" Song

Newsgroup: comp.sys.atari.st
Date: 2005-10-28 06:00:46 UTC
From: Mark Lehmann <mark.lehmann@gmail.com>
Message-ID: <1130479246.467608.164290@g43g2000cwa.googlegroups.com>
Source record: 10477

A friend and I resurected one of our favorite songs "Beachwalk" from a Music Studio floppy disk for the Atari ST. We used a program to read Atari ST 3.5" 360K floppy disks on an IBM style 3.5" floppy drive. Next we used Steem and a music program that is compatible with Music Studio to convert the .SNG file to a MIDI standard 0 file. Last we moved it over to Garage Band on a heavy duty Mac and arranged it.

You can hear the results at: http://www.marklehmann.com

By the way, I could not track down Davidow. If you are Davidow or know Davidow please get him in touch with me. I want to give him full credit for his work.

Even though rather limited by today's standards the 135MB capacity works
well with early Atari software. One word of caution though for the ST
or Mega ST computers you will also need to use an ICD Link adaptor for
SCSI drives. See http://www.icd.com/atari/ for a picture and
description of their host adaptor though it is no longer available
directly from the company.

I've created a web page that will list the status of active ATARI computer hardware projects. The
intent is to have one place we can go to find the status of 8-bit and ST(e)-Falcon-TT active hardware
projects. Of course, this can only be successful if you provide me with information. If you would like
your project listed, please contact me (remove obvious spam filter) with the correct information and
current status. I will not list e-mail addresses unless requested; only web pages. In addition, if I've
listed incorrect information or if you would like your project removed, please contact me. The URL:
http://projectstatus.atari.org

You may also contact me through my home page at http://www.josephplace.com

Thanks, and stay ATARI!

IIRC, this is because NVDI disables the blitter. If you don't run NVDI,
you may perhaps find another way to do it.

I never had garbage on the screen at all, just NVDI locks up during boot and thats that, actually could try it in 030 mode and see if boots then.... not sure why you would have corrupt graphics, are you overclocking the MB too ? I just have CT60 without bus mods here..... might boost the DSP since I think you can clock that on its own, maybe a boost for the IDE system too, not sure without looking....

There is not much to be considered here. ZIP drives work out of the box when using an adapter like the Link96/97. Most SCSI CF card adapters should also work with this adapter. In the past some users have already posted their experiences with CF card adapters here, so it is probably a good idea to check older postings from this group.

That's amazing. $127 is more than you paid for a new one when they were
still available, isn't it?
I think the Link96/97, which is more powerful than the ICD Link, was
sold for about 100 DM (appr. 50 Euros or $60) some years ago.

You'll need to emulate an Atari ST and run a program compatible with SNG files. I was able to do this with STEEM, and a program (which I cannot remember the name of) which can read Ativision .SNG files and export MIDI. After that you can import the MIDI into Cubase on WinXP.

There is a program for reading 360k and 720k floppys with an IBM style drive. If you didn't get crazy with the Atari ST's ability for do 10 and higher sectors per track and stayed to 40 or 80 tracks the program works best. Do a search on Steem and you'll find the stuff you need.

Go to my sight, http://marklehmann.com and click on Beachwalk to see what I did with an old .SNG file published in 1986 for Activisions Music Studio program.

BTW, sorry that I no longer have all the details on the program names, I did this conversion in February at a buddies house and he has wipe his system since then. However, you will find everything you need by searching on the STEEM websites.

4783. Extendos 4/IDE Sony CD/DVD drive working great

Newsgroup: comp.sys.atari.st
Date: 2005-10-31 06:24:24 UTC
From: "Edward S. Baiz Jr." <edbaizjr@comcast.net>
Message-ID: <4365b8a2a07730@comcast.net>
Source record: 10511

Hello All,

I have installed Extendos 4 and a Sony CD/DVD drive into my Hades and it all works great. I did have to replace my 2gig Maxtor drive with a Western-Digial 80gig drive though. With the Maxtor drive installed, the Sony drive would not be recognized unless I made the Sony the master and the Maxtor the slave.

The WD drive is great. It is much faster and much quieter. The only drawback is that I only use a little over 4gig of the 80gig the drive has. That is ok for now since I never filled up the Maxtor to begin with.

I also had to replace my floppy drive, but that was my fault. I accidently unplugged it, so I had to plug in the power cord. I did not get it in all the way and it came out while the power was on. I got another one from ATY Computers. Thanks Alex.

Once Roger updates his code I will be able to write to DVD-R and DVD-RW discs. Right now I can only read, but it is a step.

4784. Vintage Computer Festival 8.0 Event Guide

Newsgroup: comp.sys.atari.st
Date: 2005-10-31 07:05:54 UTC

Vintage Computer Festival 8.0
Saturday & Sunday, November 5-6
Computer History Museum
Mountain View, California
http://www.vintage.org/2005/main/

This is your complete VCF 8.0 event guide! Vintage Computer Festival 8.0 happens this coming Saturday and Sunday, November 5th and 6th, at the Computer History Museum in Mountain View, California.

The doors open at 9:30am each day. Speaker sessions begin at 10:00am and run until 2:00pm. The exhibit and marketplace open at 2:00pm and run until 6:00pm.

Admission is $12 per person per day for full event access, including the speakers, exhibits and marketplace, or $7 per person per day for exhibit and marketplace only (exhibit and marketplace open at 2:00pm each day). Parking is free, and kids 17 and under are admitted free of charge.

Homebrew Computer Club Retrospective

The VCF in conjunction with the DigiBarn Computer Museum is proud to present a 30th anniversary celebration of the founding of the Homebrew Computer Club, the legendary Silicon Valley institution that helped to launch the era of the personal computer. Bruce Damer of the DigiBarn Computer Museum will moderate this panel of former Homebrew members, including Steve Wozniak, Lee Felsenstein, Allen Baum, Len Shustek, Bob Lash and Michael Holley.

Join the panel as they recount their experiences and gab with the group as we feast on some yummy cake, courtesy of the DigiBarn:

http://www.digibarn.org/

VCF 8.0 Speaker Schedule

The speaker schedule for VCF 8.0 is as follows:

Saturday, November 5

Time Session Title Speaker(s)
------- ------------------------------------ --------------------
10:00am Film Screening: The Future of Pinball Greg Maletic

11:00am IOCCC Award Presentation Ceremony Landon Curt Noll

12:00pm VCF Shenanigans Sellam Ismail

1:00pm Homebrew Computer Club Retrospective Steve Wozinak
Lee Felsenstein
Join us in a celebration of the 30th Len Shustek
anniversary of the founding of the Michael Holley
Homebrew Computer Club. Moderated by Bob Lash
Bruce Damer of the DigiBarn. Allen Baum

Sunday, November 6

Time Session Title Speaker(s)
------- ------------------------------------ --------------------
10:00am A History of the Smart Card Jerry Svigals

11:00am Yack 'N Hack: Computers Talk Back Deborah Norling

12:00pm A Personal Re-telling of Personal Dave Freeman
Computer Retailing

12:30pm Nerd Trivia Challenge! Evan Koblentz and
three Uber Nerds
Are you up to the Challenge? Hosted vying for the prize!
by Evan Koblentz, editor of the
Computer Collector Newsletter

1:00pm In The Beginning: A BBS History Christian Wirth
Discussion Joe Russack
Ernie Longmire
A panel discussion to follow-up the
screening of BBS Documentary on day
one of the VCF. Moderated by director
Jason Scott.

For complete details on this year's speaker series including session
abstracts and speaker biographies, visit:

http://www.vintage.org/2005/main/speaker.php

Nerd Trivia Challenge

The Nerd Trivia Challenge is a trivia contest to test the knowledge of
the most serious computer history buffs. Contestants are chosen from
VCF attendees who qualify for play by taking a preliminary quiz upon
arrival at the VCF on Saturday, November 5. Those applicants scoring
highest on the preliminary quiz will be selected to compete in the
Nerd Trivia Challenge on Sunday, November 6, at 12:30pm.

The Nerd Trivia Challenge is being hosted by Evan Koblentz, editor of
the Computer Collector Newsletter:

http://news.computercollector.com

To participate in the Nerd Trivia Challenge, ask to take the NTC
preliminary quiz when you arrive at the VCF registration desk.

Film Screenings

The VCF is proud to present the first ever public screening of a new documentary film titled "The Future of Pinball":

http://www.thefutureofpinball.com

The Future of Pinball is a new documentary on the recent history of the pinball industry. The showing is a beta version of the film and VCF attendees will have a chance to help direct the final cut based on the feedback they provide.

Be sure to catch director Greg Maletic's talk on Saturday, November 5, at 10:00am.

The VCF will also be reprising a screening of BBS Documentary:

http://www.bbsdocumentary.com

The screening will take place on Saturday, November 5, and the film will be shown in its entirety to all VCF attendees. On Sunday, November 6, join director Jason Scott and three of the subjects from the film at the BBS history panel at 1:00pm.

Tours and Excursions

Guided tours of the Computer History Museum Visible Storage collection will be conducted on Saturday, November 5, with Visible Storage open for self-guided tours on Sunday, November 6.

For those interested in touring the DigiBarn Computer Museum, curator Bruce Damer will lead an excursion into the Santa Cruz mountains that will disembark from the VCF at 3:00pm.

Complete details and tour times are available on the VCF 8.0 website:

http://www.vintage.org/2005/main/tours.php

Bring On The Exhibits!

Once again the VCF has attracted some rather fascinating exhibits. Check out what we've got in store for VCF 8.0:

http://www.vintage.org/2005/main/exhibit.php

We look forward to having you at the Vintage Computer Festival. I'll see you there!

Best regards,

Sellam Ismail
Producer
Vintage Computer Festival

4785. HD soon for sale (when I find the thing)

Newsgroup: comp.sys.atari.st
Date: 2005-10-31 12:37:20 UTC

Hi all,

I have a TUS HD, external SCSI, I think its 230MB, comes with DMA cable, so pretty much plug it in and your away. Actually have 2 DMA cables. I never use the thing that much thse days, tend to use my Falcon and IDE drive so no use in it all collecting dust. going by the prices they are selling for it would help boost some cash into more ST projects, so it all seems good all round.

Can post worldwide, though posting a HD will cost a small fortune form UK to overseas. Will take me a few days to find it all out, will have to format the drive, make sure everythings working fine before it goes up on Ebay. Will post the URLs up on the day.

Possibly in order to use a PC mouse while still using the Atari keyboard without having an awkward mouse adapter dangling off the computer or keyboard. This was my question at one time, as well. I would love to be able to have the option of using the PC mouse connector of Eiffel while still using my MSTe keyboard. I personally prefer that keyboard (my favorite keyboard Atari ever made) to a PC keyboard, because there's no key remapping to be done, so I wouldn't have to try to keep track of where the Undo key went. I saw one of the PC mouse adapters that go between the Atari connector and the connector end of the mouse in action. Looked quite awkward, and wouldn't work well in my situation. So to have my MSTe keyboard and a PC mouse connected, I'd have to have something like this. Picky, I know, but it would *really* be a nice feature for Eiffel, if it were possible!

If the files were created using Cubase 3.0 or higher, you should be
able to import them in Cubase VST. You can them re-save them in a
format that is compatible with Cubase SX.

If you created the files using and older version of Cubase, you'll need
to convert it to Cubase 3.0-format (using Cubase 3.0 or higher on a
real Atari...)

regards

Hello,
I am looking for a GCC C++ compiler port on Atari ST (under TOS, not
Linux).
Anyboby have an internet link ?, does it exist ?
Thank you.
David.

sparemint.atari.org

Atari version is usable only if you have 14+MB of RAM.

(btw. please do not cross-post, it is a bad thing)

I have fixed today a cache SDRAM problem with the TOS VDI function
v_pline (thanks to Roger Burrows !).
You can found an unofficial archive here where the v_pline cache problem
is fixed:
http://perso.wanadoo.fr/didierm/files/ct60_pci.lzh
The PCI part is unfinished, but the TOS works.

Regards,

Didier.

I am pretty sure if you could find a single ended SCSI drive it would work
with HD Driver. You would need few partions though under TOS.

I'm not disputing the drive, its how you connect 50pin scsi drive to the
19pin socket on the back of the ST which is the problem. but I would imagine
that you would run out of drive letters long before you got anywhere near
300gig on a ST.

> hmmm, Sounds like a Job for PeST to me.

No. PeST would not do the job as I described it in my last post. PeST plugs into the existing mouse port (which is on my MSTe keyboard), then goes to a PS/2 plug on the end of a go-between cable, which then plugs into the mouse. That's exactly what I'm trying to avoid!

What I would love to see is an adapter board, like Eiffel, that plugs directly into the motherboard, which I can mount to my case (I have a PC tower re-case). This board would give me a plug for my MSTe keyboard and a plug for a PS/2 mouse, so the mouse can plug directly into the machine rather than having a chain of adapters that get smashed, unplugged, etc.

PeST is exactly the same as other adapters I've seen in action that I didn't like the looks of. I want something I can plug a PS/2 mouse into without a go-between cable, while still being able to use my MSTe keyboard.

The only other option would be something along the lines of using the Atari end of PeST, cutting off the PS/2 end of the mouse, and wiring it directly into PeST. Kind of a pain, but I suppose it would work that way. I'd still prefer what I described above, though.

Hello Mike,

This is quite a tall order, somewhat akin to plugging two RS232 modems into a single RS232 port.

It works like this; you have the MSTE keyboard which is the modem, and the Atari which is the RS232 port. And then the extra mouse you speak of has to be connected to the same RS232 port. It simply won't work because of handshaking. In that the signals for each device will conflict as the design is a direct communication protocol.

The only solution here would be an adapter board which manages and allows such handshaking.

I do have a hack idea to overcome this however but it would de-standardise the machine. That idea would be to dismantle your MSTE keyboard, wire up a

PeST inside to the mouse port, replace the MSTE's cable with one containing a greater number of cores, run the PS2 DATA and CLOCK signals back to the where the cable plugs into the ST, and end up with a socket coming out of the lead where the keyboard plugs into the system unit.

Best of luck,

Aly

Source record: 10542

I have had a 1.2 Gig drive connected to an ST, which I carried around on contract assignments. At the moment I have a small number of 9.1 Gig drives, one of them connected to an adapter that fits it to a 50 pin bus, connected to a TT by its SCSI port. That 1.2 Gig drive has been connected to both an ST and an STe with both a Link and a Link97.

Maybe Uwe can answer, but it seems to me that if you terminate the lines on an 80 pin single-ended drive you are not using, it becomes a single ended 50 pin drive.

The way to test this would be a Link or Link2, which does not do negotiation, with a large drive. My adapter for using SCA drives comes from CS Electronics, ordered from their web site, and costs about a half a hundred dollars. $52, the last time I looked.

Someday I will find out for sure. Have a Link and a Link 97, and uses for both of them, and an old unix home2 box with a worn-out drive in it, which is what has been connected to a ST with a Link97.

19 pins does not appear to cause any problems with connecting a large drive to an ST or STe.

Jim

Hmph. You made that look too easy! <big grin>

Thanks though Alison! I've got a Compatibility Plus 2 board that I'm
trying to figure out. I don't have any docs with it, and when it came time
to insert the ROMs...well... I was just guessing and couldn't get it to
work. I just hope I didn't kill my ROMs. According to Brad at Best
Electronics, if I had them in the wrong way, I might have already
destroyed them. :-(

if your board has been made "to the norm" then pin 1 will be a square solder
pad on the pcb, all the others will be round.

Chris

4824. Eiffel jumpers

4825. Reading Atari ST ROM cartridges in a PC

Newsgroup: comp.sys.atari.st
Date: 2005-11-02 19:05:45 UTC
From: rmeenaks@olf.com
Message-ID: <1130958345.120227.301060@f14g2000cwb.googlegroups.com>
Source record: 10401

Hi,

I have an Atari ST hardware that connects via the ROM cartridge port on the Atari. I would dearly like to connect the hardware to a PC and use it via an emulator (even if the current emulators dont support this, I dont mind changing the code). Is there anything out there that will allow me to use this peripheral on the PC? Any type of Atari Cartridge-to-PC bridge? Ideally connecting to an USB-port would be great. Sorry if this is a newbie (or FAQ) question. I dont have an Atari ST and dont plan on getting one. But, I would still like to use the hardware...

Thanks,

Ram

The notch at the top of the chip will also match up against an
indentation/notch at the top of the socket.

> indentation/notch at the top of the socket.

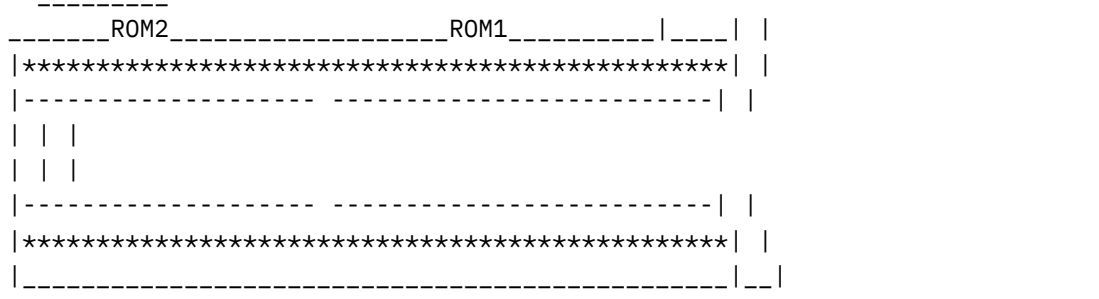
Hmm, I take it that you and Chris haven't actually seen the Compatibility Plus 2 board? (not meaning to step on toes here - just wondering!). Because its a marvel in size. There is only one regular socket (or at least what I'm used to seeing as a socket). The 68000 CPU sits in it, on top. Now if you can imagine, flip it over, and *in between* the pins that will go into the normal CPU socket on my Mega, is where the 2 TOS 2.06 ROMs sit. There is not a regular socket, just holes in the pcb board for the pins of the ROM chips. Very small, very tight. No markings in the pcb at all, and as far as I can see, no difference in the holes for the pins. There are no EO/E1 or HI/LO or HIGH/LOW markings at all. I've been able to get some of the docs (but not nearly all). Here is a paragraph:

"According to the instructions, facing the bottom of the Board, you insert the 2 TOS 2.06 Roms Pin # 1's in the opposite 180 degree direction of the #1 pin on the 68000 CPU. Look for the Words Rom 1 and Rom 2 (top edge of the bottom of the board) on the bottom of the Compatibility Plus 2 board, Pin # 1 for the ROM 1 is in the upper right corner of the Board and so on for the ROM 2 behind it"

The board looks like this:

Bottom view:

(the caret shows where pin number 1 on the 68000 chip is. (top of the board, flip side)



* = pins from board, that go into the motherboard
- = holes for TOS 2.06 ROMs

Excuse my poor attempts at drawing. :-(

So...Is ROM1 the Hi or Lo TOS 2.06 ROM? Is ROM2 the Hi or Lo 2.06 ROM?
Its easy to take either ROM and put pin #1 (thanks to your guys info)of
either chip in the upper right hand corner, but which TOS ROM goes
there? Its confusing to me with no docs/pictures in hand. :-(

Sadly, according to what I've been told if I get it wrong (which I already
tried once) the TOS ROM chips may be destroyed.

I wish I knew someone who had one setup so I could compare.

Thanks everyone.

Mmmm, technically possible, highly unlikely. If 50 million of us had
migrated from an ST to a PC then just maybe.

No one would develop this as the customer base would be so small.

The Atari cartridge port is actually relatively simple. All that's involved
is getting the I/O in the right place and at the right time and it'd work.
It's only a case of mapping 1's and 0's back n forth. The ROMs in those are
about 250ns which is 4MIPS / 4Mhz. Today's PC's could swallow that in an
instant.

Nice to dream about these things but not gonna happen, kind of dissapointing
that is, that we're capable of so much yet do so little.

Best get an ST then Ram. Sorry.

Source record: 10406

If its a ROM cartridge then you could use an ST to read the contents and then run it in an emulator, but if its dongle or something that actually needs plugging into the ST while the program is running then no.

You could build your own Cartridge > ISA bridge, assuming you still have an ISA based machine, but then if you knew how to do that, you wouldnt be asking the question.

But not all cartridge ports have only ROMS in them. There is a sound sampler cartridge that lets you sample sounds. I have an adaptor that lets you put an Ethernet card on the port. Both these must have some kind of pseudo write to get data out of the ST, (on the sampler just to set the sample rate) as the cartridge port itself is strictly "read only". Would these work on an emulation?

>
> Nice to dream about these things but not gonna happen, kind of

If its just the ROMS then couldn't these go in a ROM Board such as was used by Gemulator when emulating a MAC to hold the MAC roms...

Nope, admittedly no. But unless they're using sockets from billy bob then
it's almost rule of thumb to suggest that things are standard.

@CHRIS@ What's your feeling on this about getting the chips in the wrong sockets??

Actually, going back to that pin1 thing again, the way to truly confirm it is to trace the GND and +5v back. You'll need to find out the pinouts of the 68000 so you can confirm it, unless there's a +/- flylead coming off or similar.

They're only 1's and 0's in the right place at the right time. The ST doesn't know what's going on, it's only running code which interprets those 1's and 0's into something humans understand. Sampler, video grabber or not, the ST doesn't know that.

As Coda says over in the other sub thread, a bridge is technically possible.

It would take alot of work, and would definitely need total support from the developers of the various emulators.

All of these things are possible and start from ideas such as these. It was perhaps only far fetched for Ram to suggest it given the understandings of business economics, the technical suggestion is entirely plausable. I'm not sure about USB though.. But if USB 2.0 can manage a television / bitstream from a USB tv card then perhaps the speed is there. Design rate of USB 2.0 is 480Mbits / second. Sooo 480 / 8 = 60Mbytes / second. Sooo. 60,000,000 bytes per second best scenario. Erm, that's quite fast.

Mmmm, hope I responded to that properly ;-)

Maybe something for our USB/Ethernet developers out there?? If there's a demand though.

The PC is totally different technology. It would be like you trying to
connect a USB device to a ST back in the early 80's.

If you get the support of somewho who writes a emulator, someone who can
build the hardware adapter then its possible. Its probably that the cart
would have to be converted into something the PC can understand like USB, so
first you have to convert your cart to a USB device. You then have to write
I/O drives for the PC so it can read and understand the new USB device. You
then have to get the emulator to access the new hardware via new api calls
or whatever.

You dont say what the cart is, whatever it is I doubt its of much
importance, if its just roms, then you could read them in a eproom programer
and make a cart image file for use in emualtors. Can't see those few K of
data being of much help tho. My advice to you use buy a ST and use your
cart how it was intended to be used. Either that or save up a lot of ��� and
pay a commertial software/hardware developer at least ₤100 per hour to make
it do what you want.

Chris

<big snip>

What ron needs to do is get a multimeter, find your +5V rail (assuming it comes from the ST PSU) and measure each of the rom pins until you get a reading (beep setting would be good) it is possible that you will have more than 1 pin connected to 5V, though most are address lines so they be connected. If you can work out what pins are connected to 5V then you are half way there.

Getting HI/LO the wrong way does not kill them, I can't remember exactly what it does, but I think you get vertical lines down the screen or some odd thing like that.... I would get your roms checked out too if possible. If you have blown them up then they are probably unreadable. I have TOS206 images on my old P200 in my workshop. There are 2 checksums though (I think I only have the one) this is becasue some roms have FF in blank space and some have 00 for blank space, hence depending where you get your roms from could be either checksum. No chance if these are patched roms of any kind.

HTH.

Thanks for the reply.

Well, I'm not too concerned about the 68000 chip itself. It seems to be marked on the PCB in a standard fashion. There is a notch drawn in the rectangle that goes around the 68000 socket, just like you see on the STs motherboard, for example. So I feel confident that the 68000 is in correctly there. The 68000 chip does have the orientation (is that the correct term?) notch in it, with the countersunk dot, which I think denotes pin #1.

So it should just be a matter of getting the ROM directions sorted out.

I hope. :-)

I've got a multimeter - I need to get another fuse for it though. I blew
the fuse checking an ATX power supply the other day (am I a clumsy oaf or
what?).

You know, I didn't think it did either. A few years back, I had an STe
that I put TOS v2.06 in, and I got them backwards the first time. It just
wouldn't boot up. Once I reversed them, it worked fine. Of course, its
much easier in the STe, you just have to move that one resistor.

I'm wondering if destruction of the ROMs might just be something
associated with this board though, due to its design? Best Electronics was
the ones that told me that, and they are usually pretty reliable with
their info.

Thanks for the reply.

```
Hello all !

New version of MyMail 1.84 released.

Major improvements & bugfixes:
------------------------------
- A index file corruption problem fixed.
- Re-write of code to get faster downloads in the case when the
user is saving mail on server.
- Printing errors fixed.
- Some minor bugfixes.

Read more in the history.txt file.

Download from:
--------------

Jean-Luc,

The two jumpers that are already on the Eiffel are for the LED's. The other pins may be for attaching a cable to program the PIC. I dont have a cable to do this, I just pull the chip and re-program it.

Hello Rohry

(seems the adress I used to write to you wasn't valid :-( )
You mean it would be possible to reprogram it using the same j-tag
cable as the CT-60's (with a little change in the connector) ?
If so, could you please give us the connection ?

Thanks,

J.-Luc

Source record: 10428

Hi Martin!

First of all:

Whoever has downloaded RUN!Only, please update from our webpage! An
important bug has been fixed (hopefully...)

> Is it possible to use GBE (Gfa Basic Editor) + RunOnly! together with
> ErgoPro! from Run! software?

Of course it does :-)
Lonny and I have been developping this stuff very closely together. So
GBE and RUN!Only support each other!
And GBE supports ergo!pro, too. It sends a message, when a file has been
saved and hopefully ergo!pro does update its main window.

If you use GBE with ergo, don't forget to disable Bastard!

I have even made an English RSC file for ergo!pro. It is not perfect yet
(missing shortcuts or sensible shortcuts in the dialogs).

The Bubble Help file is also not translated yet! ergo!help will never be
translated (unless someone wants to spend his life with doing that, it
is some 400kB of source text... :-))

> But if it works it would be the best MiNT compatible GfaBasic development
> environment ever.

It does work! It should even run with memory protection. If any of the
programs do not run under MP, please report this, it will be fixed as
soon as possible.
But the RUN!Only should actually run with memory protection enabled and
under securelevel 2 (until you use some of the evil GFA commands, that
is ;-))

And plea

From: Martin Byttebier <geek@atarians.com>
Message-ID: <436bf6eb_2@x-privat.org>
Source record: 10430

```
New at the Belgian ftp-site chapelie.rma.ac.be
----------------------------------------------------------------

**********************************************************
* If a package should be corrupt, please contact *
* *
* tos4ever AT telenet DOT be *
* or *
* saka AT village DOT uunet DOT be *
* *
* so they can delete it and put a good version here *
* *
* Only with your cooperation this site can become good *
**********************************************************

Recently the ftp-server underwent some changes. As a result I don't
have fully access to the server anymore. This means for instance I
can't make symbolic links anymore.
Also for the moment it seems impossible for anonymous users to upload
to the incoming dir. Karl Samyn AKA saka negotiates with the new net
adminstrator to change this. I hope it will soon be possible again to
make uploads to the incoming dir. In the mean while you can always
send the uploads directly to me.

**internet**
ftp://chapelie.rma.ac.be/atari/internet/mymail-184.zip
(1.333.824 bytes) Nixce powerful GEM based e-mail client for STik/STing/Gluestik/MagicNet

ftp://chapelie.rma.ac.be/atari/internet/aicq/aicq165.zip
(132.345 bytes) Very nice GEM based ICQ client for STik/STing/Gluestik/MagicNet

**programing**
ftp://chapelie.rma.ac.be/atari/programming/gfa-basic/gbe-130.zip
(226.829 bytes) GFA-Basic editor is a GEM based editor modeled after the
orginal GFA-Basic editor. Runs under a multitasking system like MiNT.

ftp://chapelie.rma.ac.be/atari/programming/gfa-basic/runonly.tos
(157.120 bytes) RUN!Only is a so called runonly interpreter, very much
like the one that used to be shipped for a while by GFA themselves.
The big difference though is, that it is a clean application and
even runs with MiNT's memory protection!

**utilities**
ftp://chapelie.rma.ac.be/atari/utilities/chrmap10.zip
(303.459 bytes) SpeedoGDOS Charmap Generator Version 1.00, 1996-01-03
```

ftp://chapelie.rma.ac.be/atari/utilities/cd-rom/cdplay.zip
(200.152 bytes) CD player with CDDB support under MiNTnet

ftp://chapelie.rma.ac.be/atari/utilities/music/id3memit-v2.zip
(1.283.289 bytes) MP3 ID3tag editor. This version supports V1, V1.1 and V2 tags.

Have fun,
Martin

> from the boot block.
>

There are a few programs for the ST that will switch the video mode into
PAL mode.

Some games do this automatically.

In the past I have bought some games made in the UK that came with a PAL
Boot disk,
that you boot first, then put the game disk in and press the spacebar,
return or what ever
and the RGB monitor switches into PAL mode.

There should be a program for this on one of the better FTP sites.
It maybe called 50HZBoot or something similar. And should be a very
small file.

Also, I seem to remember a program that did this along with some other
things, but
the name of it escapes me at the moment.

You may try searching some of the online Atari ST mags for more info on
the subject.

I have my doubts on this one. JTAG is for FPGA's whereas the Eiffel uses
a PIC. The PIC programmer is usually a very small and very simple circuit
that takes a serial transfer from a PC.

Thanks,
Mark

Hallo Erik!

EH>http://erikhall.mine.nu/~erikhall/programs/mymail.html

Once again a new URL? Anyway, I've found it earlier and already added it to my online hotlist :-)

But that's not the reason I'm writing this.

I'm still using version 1.74, because with all otherwise working 1.8x versions I've tried, the SPAM filtering won't work as expected.

- I select "check mail"
- MyMail does so and says "you've got xx mails"
- I choose "details", as sometimes the SPAM filter will miss some or worse, classify non-SPAM mails as SPAM.
- The list displayed contains only SPAM messages. But once I hit the "retrieve" button, they are downloaded anyway! With 1.74, they were deleted, and that's what I mostly need MyMail for...

I don't want to manually un-check every single SPAM in the list, as in that case I wouldn't need any SPAM filter :-(

With best regards
Ekkehard

Message-ID: <pan.2005.11.05.19.51.36.499735@charter.net>
Source record: 10439

Hey gang. I guess specifically Alison and Chris. :-)

Anyways, now that I got the PeST in, I actually hooked it up to my CT60'ed Falcon, with a DEKA interface, using a Logitch optical mouse. The kind that has the adaptor that lets you use it like a serial or USB mouse. Using the adaptor with the PeST, I tried it with straight TOS, straight TOS with the CT60 disabled, and everything going, booted into MINT. The results were always the same.

The PeST works just fine, as far as movement, clicking, etc, etc, but holding both buttons down for 10 seconds does *nothing*.

Well, thats it for now. Let me know if there are any other tests or things I can try.

Thanks guys! :-)

It works fine for me, but when I get or send mail, the screen that shows the messages gets messed up. No real problem. I just have to close the window and then re-open it.

4866. CCAG Show Rescheduled to December 4, 2005

CCAG Show Rescheduled to December 4, 2005

As some of you may be aware, we are allowed the use of the National Guard Armory in Lorain, Ohio because one of our committee members is a member of the National Guard. This allows us to hold this event very inexpensively and free to vendors and attendees. In order for us to hold CCAG at the National Guard Armory in Lorain, he must attend the event. Unfortunately, Hurricane Rita activated the National Guard unit that he is in which meant he was unavailable for the now previously scheduled event date of October 22, 2005.

We have rescheduled the show to December 4, 2005, and have announced it via our email mailing lists and on this website.

The spam filter is enabled within the "Select user" menu.
This 1.84 seems very stable again (unlike previous 1.8x) and all the
post-1.74 bugs and strange behaviours seem corrected as well.
I think you ought to give it another try, after backing up your data,
then in a few days you might find it's worth it :-)

Hi Jean-Luc!

JL>The spam filter is enabled within the "Select user" menu.

That's in "Mail/User and server settings", and that's got to be new in =
1.8x but this has _not_ been mentioned in HISTORY.TXT which I normally =
_do_ read. And there is still a "Spam check mail" check box in =
"Options/Program settings/Spam filter", which used to control that =
feature and which I _did_ check. I normally do not check account =
settings that haven't changed for a very long time...

JL>I think you ought to give it another try, after backing up your data=
,
JL>then in a few days you might find it's worth it :-)

Okay, I'll do. But still, changing the behavior of a program in such =
ways isn't good programming style :-(

With best regards
Ekkehard

Yes, I held it for probably 15-20 seconds, by the second hand on my
wristwatch.

Under MINT, after 10 seconds, the menu came up, the one that normally
comes up when you press the right mouse button.

In normal TOS, it just does nothing.

4873. Canadian atari system in Brisbane QLD Australia

Newsgroup: comp.sys.atari.st
Date: 2005-11-06 23:47:44 UTC
From: WRL <wrlouis@yahoo.com>
Message-ID: <1131320864.139373.22660@g44g2000cwa.googlegroups.com>
Source record: 10350

Hi all,

I have an Atari 1040ST, w/ SC1224 monitor, external hard drive, dot matrix printer (!), extra ribbons for same (!!), and misc software including old word-processing (1stWord) and some games to give away to a good *QLD / Australian* home by November 25, 2005. (External CD drive also -this was never installed so I don't know if it works.)

Some caveats:
(1) You must be able to pick it up from Highgate Hill, Brisbane, QLD, Aus. -- at 3 boxes of stuff, it is too big to post. Don't ask me how I accidentally ended up shipping this 20 year old Canadian system to Australia.... ;)
(2) This is a North American system - you need to own or buy transformers to run the machines at 110 not Aus 240v;
(3) It's all quite grotty & needs cleaning.

That said, I just booted it the other day and all seemed well. Free to a good home (i.e. someone who will use it!) or best offer within the next 3 weeks, by November 25, 2005.

cheers,
W R Louis

I believe I've already seen this - I didn't mention not being able to
click on icons because it did go away, so I think you're spot on here.

> If you have a "RB menu" and its comming up holding down both buttons, sounds
> a bit like faulty mouse buttons, not saying it is that, but its that kinda

I honestly don't think its a faulty mouse - I took it from my stepsons'
comp in his room (Linux box). It works perfectly fine there. I'm thinking
that may have just been me not exactly pressing both buttons perfectly at
the same time, so when the 10 seconds was up, the RB menu came up. Just a
thought.

> Have you spotted ANYTHING else which is odd ? It could be a supply rail

I've got a blown fuse in my multimeter right now - got to replace that
before I can check anything. As far as the DEKA goes, it plugs directly
into the usual keyboard header on the Falcon and thats the only connection
it has, IIRC.

> You may want to try running a 5V line direct from the PSU to DEKA's mouse
> port, I dont know what voltage it runs on or where it gets its power, though

> DEKA has no regualtors, if its running on 5V and has 5V regualtors then that
> would be a bit dumb... also assume DEKA runs on 5V, its down to you to
> double check that also..

Well, TBH I bought the PeST for a "down the road" scenario. In other words, not being able to get any standard Atari compatible mice. The mouse I'm currently using with the DEKA interface and my Falcon is very comfortable for me. Its one of those Best Electronics replacement models and its worlds above the standard Atari one. So I'm actually holding on to the PeST until I need it. I hope that makes sense! Although I might just end up using it on my Mega ST... :-)

Next time I have my Falcon rack case apart, I'll plug a standard Falcon keyboard into it, hook up the PeST and see if the problem goes away. Heck, I'll try to do that tomorrow when I have a free moment and report back here.

Thanks! :-)

Hmm, too high a voltage would let the magic smoke out - too low and it
wouldn't work.

Surely these things are clocked by an oscillator!

Voltage should be 5.25volts, though when I used to service power supplies we used to set them on 5.8V, this was becase of the couple of meters cable from one end of the machine to the logic board, by the time it got to the logic board it would be 5.5V, by the time it got to the other end of the logic board it had dropped to 4.6V. All comes down to poor design IMHO, though volt drop across cables and logic boards is a problem on complex designs.

> Surely these things are clocked by an oscillator!
>

PeST has no external clock. If DEKA has a external clock then first thing I would do is take it out and try some faster values in there, or even get a programmable clock IC like CTCM uses.

Hi all,

have added in a bargain page to cps electronincs (or tried too) to clear surplus items off. A lot of it is stuff which is new which never used or just got too darn many of them taking up space.

http://www.cps-electronics.co.uk/web/bargin.asp

http://www.cps-electronics.co.uk/web/clearance.asp

Will shipworld wide, though probably not worth overseas ppl ordering due to postal costs.

Latterz
Chris

Source record: 10359

Hello,

My web pages are translated from french to english (not everything, but most of them). You can get there my programs, source codes, (french) articles written for ST Magazine.
I also updated M_PLAYER (version 3.0x has been released) with some new features:
- MPEG 1 and 2 are now correct.
- MSVC/CRAM encoder (16 bits or 256 greys) for AVI files
- a (little) better interface.

You can start your visit at http://perso.wanadoo.fr/gtello/index.html

Enjoy,

Guillaume Tello.

4883. Re: Which SCSI?

Newsgroup: comp.sys.atari.st

Source record: 10360

This topic has been beaten half to death at least 3 times, recently, so it is at least 150 percent dead. Your problem does not fit any flavor of SCSI, except SCSI I, which describes something different.

The original cables in Sun machines had Centronics 50 on one end, and a very small 50 pin connector on the other end, probably called HD50. That was their version of SCSI I, while everyone else using SCSI I was using cables with Centronics 50M on both ends.

What you need is a DB25M to HD50M cable, and if you ask for that, you will get what you need. It is not possible to predict what will be printed on the package label.

Jim

Yep, although to be a bit more precise, mine does jiggle slightly.

The PeST IS in setup mode, however, and one can select the various
modes well enough. For me, only one of the four is pleasant to use.
Which do you prefer?

Galen

I never even tried any of the modes, once I saw it wasn't working like it
was supposed to. Guess I'll have to hook it back up - or better yet, to my
Mega ST where I can see what its doing. ;-)

Umm, if I recall that thread correctly, it potentially can blow something
like a resistor or capacitor on the Falcons motherboard and you have to
replace it.

Its a very bad thing to do, from my understanding. I hope not in your
friends case, maybe he dodged a bullet. :-(

Now that this auction is over and done with (with a bid of $1,635),
does anybody here now what became of the deal? Did the seller decide
this was an adequate price? Was the buyer active in this group? What
sort of wonderous treasures were extracted from this storage unit from
hell?

Hello Carey,

It could be something as simple as a bent connection since it was put in upside down. Happened to me once. Or it could be that something is blown on the motherboard, but I do not believe that is the case.

When and where does he get this message about the services? It also could be something is messed up in his settings, most likely in his ETC folder. When I installed my new Western Digital hard drive, I could not connect either with MagicNet. Turns out files in my ETC folder had to be replaced.

Hi Folks.

Have any of you had any success with using a Hitachi DK23CA-10
(10 Giga Byte) IDE drive in a Falcon ?

I am using HD 7.1 . The program lists the drive but cannot see it
when I try to partition. The Falcon Just bombs out.

I seem to remember reading somewhere that a Falcon could access max
128Gbyte. Is that really so ?

The drive checks out ok on my friends PC notebook as being fully
functioning.

Any ideas please as new drives of low capacity are now almost impossible
to find.I am using a 6Gig IBM DCMA 21440 drive with no problems on my
Falcon but my wifes drive on her Falcon is going down fast and I need
to replace it as soon as possible.

Cheers,

Paul.

You might need a later version of HDDriver? I think you can download a 8.x
demo that should tell you whether or not thats the problem.

I'm not sure what the total top size is for hard drivers on the Falcon. I
believe its about 1 gig per partition, up to the letter P? Not sure. Using
something like MagiC or MINT though, you can certainly go much higher.
I've got an 80 gig Maxtor HD that works fine with MINT.

HTHs.

Hello guys,

I'd like to announce my intent to create a nice IMAP email client for GEM. It won't be great at first but time to first product should be very very fast since I'll be developing it on the libetpan library. As with most of my productions it will be MiNT only due to library dependencies ;) How soon will you see results? I believe GIM had a release about 6 month after I announced.. Hopefully it will be sooner. I'm going to be working also on a C# project for work so my time will probably be stretched. I've been slacking so bad on my Atari stuff lately :-/ Time to get back and finish what I started with Sparemint 2.

Thanks,
Mark

Can you please send me your serial number, so that I can add you to my
database of registered users? Thank you.
You should use the demo version of HDDRIVER 8.1
(http://www.seimet.de/hddriver_english.html) for testing it with your
drive. 7.1 is rather old.

> I seem to remember reading somewhere that a Falcon could access max
> 128Gbyte. Is that really so ?

Yes, this is correct for IDE drives. For SCSI drives there is no such limit.

4917. closing down stock clearance

Newsgroup: comp.sys.atari.st
Date: 2005-11-11 10:36:37 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <cMydnSAU5cOU6eneRVnyrw@pipex.net>
Source record: 10394

I am going to place all my stock of my 1.44 upgrade on
Ebay in the near future. There are around 30 PCB's and probably around parts
to build up about 10 modules. Instructions and such are on my website. The
kits (excluding drives) I have been selling for £25, though I will make a
you a offer for the lot at a fraction of the cost. URL
http://www.cps-electronics.co.uk/144/HD4.htm there are links to instructions
etc from that page, you might want to leech the pages before they are taken
down.

While on the subject, I also have 3 STFM's I upgraded. Was selling these for
£65-100, though not asking anywhere near that, if you are interested or know
anyone who might want one then let me know. open to *sensible* offers at the
moment,
the list below is what I think is baged up in the loft at the moment..

```
---------------------------------

Atari 520 ST FM

Totally stripped down, cleaned & serviced. Keyboard has been totally striped
down, cleaned, and had ports re-soldered. Good case, not new.

Upgrades -

- Hardwired 4MB 72pin SIMM

- New 1.44 Sony drive fitted with our own fully automatic contoller module.

- Updated to Rainbow TOS 1.4

-Good case, not new

-----------------------------------------------

Atari 520 ST FM

Totally stripped down, cleaned & serviced. Keyboard has been totally striped
down, cleaned, and had ports re-soldered.

Upgrades -

- Populated to 1MB.

- New 1.44 Sony drive fitted with our own fully automatic contoller module.

- Updated to Rainbow TOS 1.4

- New case

-----------------------------------------------
```

Atari 1040 ST FM

Totally stripped down, cleaned & serviced. Keyboard has been totally striped down, cleaned, and had ports re-soldered.

Upgrades -

- Populated to 1MB.

- New 1.44 Sony drive fitted with our own fully automatic contoller module.

- Updated to Rainbow TOS 1.4

- New case.

Also have piles of ST spares if you ever need anything, sold out of floppy drives a while ago though!

A lot is also electronics items such as cables etc, they are on www.cps-electronics.co.uk check out kits & modules and 1 pages. Trying to clear out as much stock as possible as quick as possible. Open to sensible offers on "lots" of items. Have boxes full of some items. Cables etc are selling at half the price I brought them for to clear.

Also a lot of stuff on Ebay , Atari & electronics items. Electronics items probably not much interest to people here though...

http://search.ebay.co.uk/_W0QQfgtpZ1QQfrppZ25QQsassZexxosQ5fuk

If I can think of any more ST items I will post them on here as and when..

Cheers,
Chris

Hi Folks.

" The Life And Times Of The Atari XL/XE Series " features on pages
78 - 81 in the latest Micro Mart magazine (10-16 Nov 2005).

Collectors of Ataris should check it out as the mag will not be on the
shelves long as it is a weeky publication.

Cheers,

Paul.

4919. LARGEST COMPUTER COLLECTION UP FOR AUCTION...RIGHT NOW...570+ computers

Newsgroup: comp.sys.atari.st
Date: 2005-11-11 22:08:32 UTC
From: "Dimitri Kokken (info@fki.be)" <dimitri.kokken@pandora.be>
Message-ID: <mC8df.27933$rA.12128@blueberry.telenet-ops.be>
Source record: 10396

Hi there,

if you're an old computer collector I'm sure you'll be interested in the (probably) largest old computer sale EVER. Over 570 old home computers are up for auction at
www.mo5.com/dimitrisales/
All you need to do is register (it's free and done in 20 secs) and then you can start bidding. If you want to have a look at what's up for auction without registering, that's possible too of course, just click here then :
http://www.mo5.com/dimitrisales/auctions.php?tri=4&limite=533
Some very very very rare items are up for auction, the most famous one probably being the Commodore 64 GOLD WITH commemorative plaque!!!
But there are many other fine items, if you're a collector, I'm sure you'll find them quickly enough :)

Right now, 145+ collectors are already bidding...so don't hesitate or you'll be too late!
ALL AUCTIONS END DECEMBER 4TH 2005

Oh...if you want to see pictures of the collection, go here :
http://users.pandora.be/F-242/Computers/NewPics-25-10-05/
And if you want to see the complete list with direct links to these pics (not all comps have a pic yet) go here :
http://users.pandora.be/F-242/Computers/Computer-List-Dimitri-with-picture-links.htm

That's about it...good luck if you intend to bid.

Dimitri Kokken,
Belgium

4921. Need Info on Panther Graphics Card/Adapter

Newsgroup: comp.sys.atari.st
Date: 2005-11-12 00:03:52 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <zhadf.9095$%k.1499@bignews6.bellsouth.net>
Source record: 10398

I have acquired 2 Panther Graphics Card Adapters and 1 Graphics Card.

Does anyone have any experience with these, if so I could use some basic info on them. I do not have any software for these and am not sure if any
is needed except for maybe NVDI which I have.

If I am not mistaken, this will work in a 1040STE, but not sure.

Which Atari Computers are these suppose to work with?

I believe the graphics card is a ET 4000.

I don't have it in front of me to be sure, its still in the box.

Any info about this is much appreciated.

Hi all

I am looking for a english rsc for N.AES install. Any info or links are greatly appreciated.

I bought a CD version from 16/32 Systems some time back, but when I start the setup.app, the text is in German. I would like a SETUP.RSC that is in English. Is there such a file?

Or will this file need to be edited in a RSC editor?

Rory

As far as I know the setup program is gemsetup.
You can find gemsetup201.lzh, which includes English rsc, on the
Belgian ftp-server.

ftp://chapelie.rma.ac.be/atari/utilities/gemsetup201.lzh

Hope this helps

It is wise to install N.AES by hand... I remember many pppl had probs or
had tad weird setups after they used installer.. Wouldbe glad to help u
with installing, just drop me a mail if u will have problems...

I hope that you could fix the handling of large hard disk partitions?

For example: I have a 4GB partition and not only that it takes very
long to get information about this partition (with CTRL-I) it also
gives the following wrong values:

Total space: -9445376
Bytes used: -207933739
Bytes free: 59719680

>I must admit that I do not understand this fascination with very long
>filenames ;)

Sometimes you just get disks with long filenames and then a desktop
should show these files. :-)

Apart from that there have been times when there was no opportunity
to enter MP3 tags so you had to use the filenames instead. band,
album, title etc. In this case you could sometimes get very long
filenames.

>People have contacted me with very useful remarks about features which
>did not work as declared, or missing features which would be useful. S=
ome
>of those suggestions have since been implemented in TeraDesk- so, if y=
ou
>have some specific objections, please let me know, and maybe something
>can be done about them.

Well, one feature I am missing is the opportunity to use a different
program for shutdown.

Two other features I am missing but are not that important is to load
a true colour image as a background picture or using a
different window background picture.

Regards,

Frank

4932. TT Rom image?

Hi Folks!

Trying to get an old TT up and running. Fixed the PSU, upgraded the RAM, swapped the HD but still a couple of things to do...

The machine has German ROM's. Anybody got a 512k image of UK TOS 3.06 ? Tried the image on http://home.ptd.net/~cjhafner/ but this is only 256k and generates checksum errors when burnt to EPROMs

Also, the HD has been formatted & partition with AHDI 6 and the driver installed using HDINSTALl but the drive still refuses to autoboot (Tried various HD's) Any suggestions?

Still after a UK TT Keyboard. Anyone??

Cheers,
Dave

You should check whether this is a problem of AHDI or a general problem,
with might be related to your hardware, e.g. the NVRAM, by trying
another driver. The demo version of HDDRIVER can be used for that:
http://www.seimet.de/hddriver_english.html

A bit off topic, though I got 10 transistors shipped form USA to UK, cost me
£45 for a package which should have only cost £5 tops, make u you don't get
caught out with "dimentional weight" , the company I delt with even had a
postal calculator saying $7, needless to say when they charged £40 extra I
wasn't happy, wasn't a small company either!

Janez and all,

Ok, I will probably need some help.

Installed N.AES with MiNT. Boots fine, but when I shut down improperly,
the MiNT partition doesn't get fsck'd. It just boots into Thing and
when I open the MiNT drive, I get an error:

pid 15 (Thing): Ext2-FS (E):
WARNING: mounting unchecked fs
running ef2fsck is recommended
[OK]

I click OK, then the drive directory shows.

I'm assuming the drive is dirty, but a reboot should result in a fsck
done on a dirty drive. It does not happen. One of the .CNF files shows
the line where the shell is run with fsck, but I cannot tell if this
.CNF is actually used. There are several MINT.CNF files in different
folders, so debugging this is a problem.

I'm not against in starting over. So if there is a defacto-install FAQ
for MiNT, I'm willing to put it to the test.

I've tried EASYMiNT, but I kept getting errors in the TMP folder about
decompressing of files.

Rory

Source record: 10315

WOW what alot of crap from someone not bidding on any auction.

1) I buy new boxes. Boxes that fit the item.(No dumpster diving here)
2) I use a lot of packing peanuts. Boxes are stuffed
3) I dont want any hassle with items arriving broken. I have shipped
Atari componets arround the World and never has anything arrived
broken. I want people to be happy with their purchase. Not pissed off
about a broken unit.
4) NEW boxes are NOT cheap but are worth it to prevent crushing. Used
boxes have usually been crushed and lost their strength.

Ive added $5 for a ST and $8 for a monitor. The monitors alot more
packing than a ST to arrive safetly. The boxes are costing me few cents
less than I charge. I roundedd it up to make it easy. Im not hiding
anything and if someone wants a different shipping method they usually
ask and I gladly get then the quote.

Get a life.....

Not sure about a FAQ for the installation, but I have some information on it somewhere.

>I've tried EASYMiNT, but I kept getting errors in the TMP folder about
>decompressing of files.

For me, Easymint was the best way to install Mint. It worked out great. When I got everything the way I wanted it, I backed up everything on to a CD. I am glad I did as my Mint partition got so screwed up I had to re-initalize my partition. I plan now to put it on a 2gig Jaz cart. I just have to format a Mink exts partition and then put everything back using my CD's.

What I'd forgotten about was the command line in MMX
Preferences/Devices, which allows you to use Mac printers :-(

Mine reads "lpr -P LaserJet_5 -o raw %s" FWIW.

A Master Class in setting MagiCMac X up would be very welcome,
especially any info about accessing the Mac's Ethernet Internet
conection - someone must have done this by now?

I'm not sure what you mean about Linux here Edward. I've got Linux running
on 3 comps and a laptop, all using the Reiser FS, and power outages have
never done anything to them.

I've found it to be much better than the results I've seen personally when
you just switch a Windows machine off... :-)

Well power off etc on unix just triggers filesystem check, but rarely do
any damage, in worst case u may lost some cached data.. If one would made
check on TOS file system after power offs etc, it would be a lot safer as
well, problem is, on FAT based systems, check take forewer to complete...

Running MiNT many years now, did a lot of power off's (minix and ext2
file system) and crashes (coding in MiNT) and never lost any data in 10+
years. I did lost whole partition when i played with mke2fs app though ;))

Most Unix file systems use a journal today, which makes them even more
reliable in case of an irregular shutdown.

Absolutely. As I mentioned in my post, I use "ReiserFS" here. Works great.

Actually there is a ACSI to IDE interface. Its still in development.
Ive tried to contact the developer but nothing back and that was a few
weeks ago. Its called IDE Devil.
Heres a link:

http://neuron.tuke.sk/~nohaj/acsi-avr-ide/ide_devil.html

check the links at the bottom of the page for photos (have to click on
the jpg to see it.) Also has the schematics for the device.

OpenSource and OpenSchematics design so anyone can contribute to this
project and make other advantages or bug-fixes

Source record: 10340

Hey Folks,

Doesn't anyone have or ever used a Panther Graphics Adapter/Card,
in a Atari ST/STe/Mega ST?

I have only been able to find one page in German about it and it seems
to
mostly mention the Panther2 Graphics Adapter/Card, which looks like the
ones I have. I suppose that there may have been a updated version.

Anyway, I have no real instructions on installing or using these
adapters.

These came from Toad Computers, not sure if any were sold in the US
or not.

Anyone know of a Review in a Mag, or better have a manual or
instructions
on installation and use of these Adapters.

It appears that the adapter is plugged into the 68000 socket and the
68000
chip plugs into a socket on the adapter, but not sure. There are also
a few spare chips that go somewhere, again I'm not sure where.

Any info would be a big help.

Hello,

I just want to tell you that I come back in the atari design after a long
period (45 days) of inactivity because of moving in my new house...
I just get a new aDSL line and it is really better to work ...

What is rolling :
- CTCM are ready and should be come back from assembling.
- CT63 : wait for more orders to get enough money to order 060 and
components entries into the factory.
- CTLink : hum, I do not know if I will finish this...No time and I get
really more motivation around CT60/63 and the CTPCI...
- CTPCI : I will in the few day begin the first important brainstorming so
see the big line to follow and how to solve the bus frequency adaption (the
PCI bridge is half the clock of the CT bus).
- New machine project : later

Thanks for attention.

Couldn't bus arbitration be implemented for CTCPI so the bus speed is
irrelevant and it can be hard clocked at 33 or 66MHz PCI?

Thanks,
Mark

4973. Falcon 030 on eBay

Hi,

Sorry for the sales pitch, but after I posted here I while back about
my problematic Falcon, I received several emails requesting to buy it.

It's finally on eBay, with pics. There's some kind of short or
similar issue. The system will occasionally boot from floppy, not HD
anymore. Its got a 14MB upgrade and it looks like at least one or two
other mods have been added, but I can't verify.

Thanks
SJ

Bus arbitration is not the problem.
The problem is that CT60 bus signals are synchroniezd on a clokc that is
between 66 to 100 MHz.

And the PCI bridge can run up to 60 MHz...

So, it is a pure obligation to get PCI = CT / 2

So, all the bus signals must be re-synchronized ...

Regards

4980. Atari System Disks

Greetings.

Is there a Atari CD that contains all or most, System Disks
for each Atari ST Computer?

Or maybe a Online Site that has most all Atari Computer
System Disk software?

I am mostly looking for the System Disks for an Atari Stacey.
Could also use the manual.

Hi,

I took a look at the motherboard picture and it looks like you have a
upgrade
called the Nemesis installed.

This is probably where the trouble is.
You could double check each wire to make sure you don't have a weak
soldering
connection.

Some Nemesis owners had the Videl Option done which requires a Toggle
switch. This allows the Falcon to work with a RGB Monitor.

If you don't have a Toggle switch then the Videl Option probably wasn't
done.
And I would think it would only work on a VGA monitor.

Or this is some other type of upgrade, but it sure looks like a Nemesis
to me.

I installed one of these on a Falcon of mine, but ended up removing it
and installing
a CT2B instead. (Still have the Nemesis hardware, software, and manual
here)

I was considering bidding on it, but I don't do Pay Pal so that counts
me out.

Hi Phantom,

P>I am mostly looking for the System Disks for an Atari Stacey.
I don't think anybody needs a system disk for an Atari Computer. The system is to be found in the ROM chips.

AFAIR the ancient system disks just provided BASIC or LOGO, but no interesting soft.

P>Is there a Atari CD that contains all or most, System Disks for each
P>Atari ST Computer?
And because Atari (yes, the brand still exists) or its buyer still holds the TOS' copyright, I'm afraid that there will be no such disk.

Please correct me if I'm wrong.

Und TTschï¿½

thanks for the info. There was a loose wire, but soldering it didn't
help...could be that that extra heat on those old components was a bad
combo.

There's no toggle switch, but I've only got a VGA monitor to hook it
up to.

I don't do anything but PP anymore, there's way too many issues
dealing with checks, MO's etc...

Thanks for looking though!

BTW, I notice in your description of the Falcon that you can't get it
to boot from the Hard Drive.

In the picture you have up, you do know that the Hard Drive ribbon cable
isn't attached to the
hard drive don't you?

If not, then there's no way it will boot off the HD with the ribbon
cable off the hard drives Pins.

Also the upgrade looks like one of the early nemesis. There were a few
different versions.

What I mean is that if you do not shut Linux down like it is suppose to be
shutdown, you will have problems and will have to run a program like ef2fsck
before you can boot.

Its not nemesis, nemesis had a bunch of smaller SMT chips like CT60 has.
Looks like a molished copy to me.

When using a journaled file system there will not be any problems. This
does not mean, though, that one should simply switch off the computer
instead of correctly shutting it down, but journaling ensures that the
file system is always consistent.

Umm, not with a journaled file system like Reiser. I use it on all 3 comps
and my laptop here.

If one gets shut off accidentally without shutting down correctly, (say, a
power outage, rare lockup, the dog brushed the power switch, whatever)
when you turn it back on, it simply complains about not being shutdown
correctly, and goes ahead and does whatever is needed. There is no user
intervention required at all.

I believe only once, in about 3 years have I had a problem that did requre
me to do something extra. I had to rebuild the tree on a system, but I'm
pretty sure it was because of an older/failing hard drive that I wound up
replacing anyways.

Cool stuff...

That's fine, I can do Pay Pal if I want.

I really don't need this one.

Truth is, I have more than enough Falcons to keep me
Busy. I just got my second CT2B Falcon with a complete
boxed all original Cubase Falcon Audio with Dongle and
DSP clock plus most of the original updates and extras.
It's in super nice condition with the Centek Ram board.

Also just got in 2 Staceys with lots of original ST-Falcon
software, CDs, books, mags and hardware.

That with the Panther Graphics Adapters/Card and the
nice Nova Graphics card for my MSTE is enough to
keep me busy for some time.

I have 6 or 7 Falcons now. Just about lost count.
With extra parts, cases and etc.
And have been buying hard to find items and extra
stuff to finish some projects and maybe put a few
new Atari items on the market that I've worked on for
some time.

I will have some extra original software and hardware
that will go up on E-Bay or somewhere later on after its
sorted.

Just trying to help the owner of that Falcon possible fix
the problems that he has had with it, not here to start
a Flame War.

Thanks for the help. I think I have a Original TOS Disk version 1.00 or
something like that. It was for early STs that booted up with TOS on a
disk.

I know that it will actually bootup on my TOS 1.62 1040STE.
Have used it to run some really old games, than normally
don't work on the STE.

I thought I saw a similar version that you have, think it was version
99?

I'll have to check the disk for the version, if its different then I'll
send ya
a copy. Other wise I think you all the Systems disks that I do.

4999. Best FlatScreen Monitor for Falcon

Newsgroup: comp.sys.atari.st
Date: 2005-11-20 04:15:07 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <4JSff.41856$xK1.24907@bignews7.bellsouth.net>
Source record: 10276

Greetings,

I am looking to update a few of my Monitors to FlatScreens.

And was wondering if any are made that will support the
the lower RGB ST Resolutions and still work fine with
the Falcons VGA Resolutions and enhanced Resolutions.

Anyone know of a Brand and Model that will do this?

phantomm@bellsouth.net

5001. Falcons Device 6 and 7 problem

Newsgroup: comp.sys.atari.st
Date: 2005-11-20 04:32:01 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <WYSff.41955$xK1.16564@bignews7.bellsouth.net>
Source record: 10278

Greetings,

From my understanding of the Falcon, there was a problem with the modem port that would not allow it to achive higher Baud rates.

For this reason, the infamous software patchs were created to fix this problem. Most Falcon owners probably know what I'm talking about.

Any way, Is there a Hardware fix that one can do that would eliminate the need for the software patchs?

If such a fix is known, is it somewhere online?

I for one would like to fix the hardware and not have to use the patches if possible.

And if one can add another modem port to the Falcon, thats a upgrade I'd like more info on as well.

This is something that I've been looking at long and hard as well. What I've found so far, is that some of the newer LCD TVs that can double as computer monitors (with resolutions 1024x768 and higher) *should* fit the bill. Unfortunately, they are rather expensive! From Google searches I've seen models that actually list a horizontal freq of 15khz (which is what is required for RGB stuff).

Try entering "15khz LCD TV" at Google, and you should get some of the same results I did. I checked through several brands and models. The cheapest I could find was 15" models for around $500-600 or so...

No hardware necessary. <http://www.scheutzow.de/>
Ask for HSModem

> And if one can add another modem port to the Falcon, thats
> a upgrade I'd like more info on as well.

Use HSModem and take the Lan port as the second serial interface

The most common problem is that older software would not run at greater
than 19,200 baud. The cure is to use more recent comms software and it
pays to use HSmodem as well. Hsmodem replaces the routines used by tos,
in much the same was NVDI etc works. Just more efficient code.
Some early Falcon's had a bug where the serial port would not work until
the machine had been reset. FWIR it was only a handful of Falcon's
effected.

Hi Ronald!

Hey man.... for this Money I could buy two of the 70CM (28") TV-Set, I use now (249 bucks "Welltech" at "LIDL" Foundation). With Black-Matrix CRT and Philips Tuner integrated. The Tuner is surprisingly working very well, obviously bez of Philips.
Well, the Technology seems to be from the late eighties (Circuitry, Schematics etc.), but the TV is new, of course. The Picture is nearly as good, as my old (still working) Philips TV (also a Valvo-Tube integrated - already). The Philips is so old, I connected every HC I know (had/have) of. I got it 1983 :-), at this time such tech costs about 1000 bucks. Today you can get it for the half-price. The best Tech till now, for watching TV, IMHO. Plasma does not endure the quarter of the time my Phillips does, and still do so :-). LCD is nothing to speak of. Beamers are nice but make also clunky LCD pictures and need every 1000h a new lamp, nothing for people letting the TV-Set running for many hours a day.
Well, LCD is at least economic (lower power consumption) for longtime-watcher, but you have to sit like an Elk in front of the screen to see something. Or a Remote controlled LCD Swivel-Arm ;-)

Paying 500 bucks for a Micky Mouse-Screen and such a low-tech (256 color information) is below my understanding. Why pushed the Industry the PC to make colors beyond 24bit, when they make afterwards such a low-quality monitoring of that :-) ????
Well, Iti¿½s sharper O.K. But did the PC industry not try to make smooth edges (pixel), going with computers? And now all this pixxy, clunky stuff comes back!? Investing GHz of CPU Power to anti-aliase it afterwards. I do that with my CRT and the Aperture Grill. Mechanical Anti-aliasing is the real Stuff.

This all is for me a fundraising campaign. ;-).... Not with me.

Best regards,

Daniel Mandic

P.S.: The TV mentioned id fully digitally outfitted (where digital should be, hehe), with all controls needed. PIP!, Teletext. Receives smooth, afterglowed and fast analog Television, from the best analog TV-Stations of the World. PAL+, NTSC, PAL, 3 Scart, 1 Video IN, 1 S-video In, etc etc etc.... dark, black picture...depth of field, of course due to Analog TV.

Hi Mark,

Yes, I know that HSModem is the most common software fix for this
problem. But it is rather old, but still works fairly well.

I was just wondering if there was a hardware fix, so one did not have
to use HS Modem to get higher Baud rate speeds?

I believe that the part of the problem had to do with software that accessed a modem port that was not really there. And HSmodem fixes this problem thru software. Maybe I'm not totally correct on the above, but seems I recall it being something like that.

I was wondering if one could put a modem port in the correct place so software would be able to access it with out a software patch.

And or sometype of hardware path/upgrade to eliminate the use of HSmodem if one wants.

I have often wondered if HSmodem is compatible with some of the newer hardware upgrades and some software as well.

Not trying to put HSmodem down. As it is about the only known software fix for the problem that I know of.

I would like to see a newer software patch at the least.

Think I'll just purchase a few cheap 15 or 17 inch FlatScreens and use
the
good ole reliable Magnavox RGB monitors for RGB work on the Falcon.

Would be nice to find a FlatScreen that will do both at a reasonable
price.

Not really looking to purchase a TV. Some of the Monitors that will
kick down to the 15.75 kHz needed for RGB modes will display a TV
signal anyway. My old Mag Pro RGB monitor will do this.
It is the best RGB monitor made for ST-Falcon RGB work that I know of.
Plus it allows Atari 8-bits to be connected, even at the same time as
a ST or Falcon and ya just have to press a button to switch displays.

I finally found a new one, that I bought for around 20 bucks. Still in
the
original box with manual and cables. That does have the ST port.

Some have everything but this port. Only the PRO version has the
ST port on the back.

I have seen these at some Atari dealers being sold for around $300
Bucks.

Daniel, thank you for that information. Unfortunately, from all that, I wasn't able to ascertain one thing - does it work with both (s)VGA and RGB modes on the Falcon? Also, I would find it rather difficult to put a 28" model on top of my Falcon Rack case. :-(

I mean, without changing monitors, can you boot up to an SVGA screen, then run an RGB demo (say Hydroxyd or somesuch) without having to day anything else?

That was really what I was talking about.

Also, from the tech-specs on the models I was looking at, they achieve far greater colors than just 8bit/256...

Thanks much.

Yes, I understood. Well, what about a Multisync 15-38KHz, 50-100HZ
(85-90 nominal) or so. I saw Industry Monitors, ranging from 7-28
inches. B/W, color... everything. The Case is ugly, but the CRT are
best. Black Matrix etc... Multisync!!
The 28" one makes 15-40KHz... I could connect many different computer.
Also PC-Games, as I play mostly 640x480 or 800x600. No VGA to RGB
Converter needed anymore :-) Just connect a VGA-Plug and doni¿½t go over
38 (40) KHz ;-9

I will look around and tell you what I find.

Hi folks,
I seem recall that someone posted some instructions for getting XP to recognize 720K floppies without having to set up a second OS. I know I printed to instructions out but seem to have lost them so if anyone out there know the answer could you please either post it again or E-Mail the instructions to me.

Thanks,
Stephen Moss

No, because it is a software problem, not hardware. The only thing you could do is patch TOS itself.

There were a few redirectors in the early days that allowed programs like Freeze dried terminal to work on a Falcon. The Falcon's serial ports aren't the same as an ST's so you had to fool it into using another port. Serial 1 instead of Modem 1, IIRC. But you could not go past 19,200 baud, in that scenario. The Falcons serial ports are designed to go a lot faster than an ST's, upto around 115k baud, in theory IIRC.

>
> I was wondering if one could put a modem port in the correct place
> so software would be able to access it with out a software patch.

It is in the correct place. ST's support 4 serial ports, Serial 1 & 2 and Modem 1 & 2. The ST only had serial 1 whilst the Falcon had Modem 1. The Falcon used the SCC chip and the ST the MFP. The Mega STE has 3 serial ports (the lan could be used as a forth, as also you could in the Falcon). The TT has 4.

>
> And or sometype of hardware path/upgrade to eliminate the use
> of HSmodem if one wants.

You don't necessarily need to use HSmodem. Hsmodem replaces stuff like flow control routines in TOS, it is a just a OS bug fixer. Use Mint and you don't need it. Not sure about Magic.

>
> I have often wondered if HSmodem is compatible with some of
> the newer hardware upgrades and some software as well.

Most likely just not necessary as the custom TOS may have had the bugs fixed, if it hasn't then you will most likely need it also.

>
> Not trying to put HSmodem down. As it is about the only known
> software fix for the problem that I know of.
>
> I would like to see a newer software patch at the least.

IIRC, mint now has the modern equivalent of HSmodem built in.

Anyway it is like this,

ST/E/FM MFP
MegaST MFP

MegaSTE MFP SCC
TT030 MFPTT SCC
Falcon030 SCC

Atari just dropded the MFP port, because it was slow. The MFP could only go to 19,200 baud unless you overclocked it to 38,400. In the overclocked state you need HSmodem to drive it as TOS is not capable by itself. The SCC was a high speed uart, not designed to be compatible with the MFP at all.
Programs like Connect can talk to the SCC quite happily without HSmodem.

http://www.atarimagazines.com/startv5n6/tterrific.html

Has some interesting info on the serial ports, worth a read.

Mark

Hi Stephen!

Just close the High Density-Lid, with an Iso-Tape or something similar. The Floppy recognizes HD and DD disks via this hole. Without hole it is a 720K. And the magnetic disc going with HD-Disks are even better, one day. Today itďž˝s all the same poor quality.

Best is 5.25", the longest reliability. Also 1.2Meg. I have some "Oracle" disks, and the data is still readable. The most of my 3.5" Disks (Amiga, Atari, PC) are dead :-(. 5.25 are all working (Atari XL, C64, Amiga, PC).

Best Regards,

Daniel Mandic

Just pop in a 720k disk on a DSDD disk and it will read it fine, if the disk is formatted with higher sectors or tracks it will not work.

Well the Stacy disk has the HD tools program and park utility that is needed
if you need to format the drive.

I don't think there is a problem with downloading Atari ST System disks as there is nothing more than BASIC, LOGO or HDx on it and they all came with every ST computer anyhow, so there should be no problem as long as the user has a ST computer. TOS ROM code on the other hand, is copyrighted as that is the actual OS which is burned in ROM. The only computer that loaded TOS from disk was the very early 520ST computer, and that TOS is very buggy and pre 1.0 anyhow.

Thanks for that info, it will come in handy.

I really need to get a Falcon Field Service Manual so that I can
learn more about the chips in there. Some I know well, others
I don't.

I know that Stalker also has custom code to work the Falcons Modem port
to
very high Speeds. Never used Connect that much, I prefer STalker. The
Back Talk Script is interesting as you can write your own stuff with it.

IIRC, there was a article somewhere on adding another Modem or Serial
Port
to the Falcon. It's been so long, that I forget where I saw that at.
Maybe on a
Atari CD that I have here.

5017. Bad Timer frequencies

Newsgroup: comp.sys.atari.st
Date: 2005-11-22 06:56:16 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <4382c10d$0$21302$8fcfb975@news.wanadoo.fr>
Source record: 10294

Hello,

Working on sound synchro with images, I had always a delay between sound and frames without finding the bug.

Then I wrote a little tool to test the actual frequencies generated by the MFP for the Timer A. It revealed that the theorical frequencies are not the actual ones on my Mega STE.

For example, for a 22 kHz sound, the MFP can generate 21943 Hz (the closest). Testing it, it appeared to be 21843 Hz, 100 Hz less ! 2 minutes after you get 0,5 sec of delay.

I put my tool here http://perso.wanadoo.fr/gtello/timer_e.zip (7kb, sorry for the poor interface), can anyone test this 21943 frequency and tell me if every Atari is concerned or if my Mega STE has problems?

Thanks!

Guillaume.

I used to use Stalker as well great program. Remember though it isn't
custom code, it is done as per the standard Atari spec for talking to
the SCC chip. It was also capable of talking to the MFP chip and the
RS-422 port. With HSmodem and the overclock mod you could talk quite
happily at 38,400 baud.

I could probably find that for you. I have it archived somewhere. Only useful if you want to run more than 2 modems. You can use the LAN port as a serial port, which means in effect you have 2 ports. But I don't think they could be driven at the same time.

Mark

I think the article was for formatting 720K not reading them in XP. As long as its formatted 720K on the PC then there shouldn't be any problems. XP itself does not seem to want to support 720K formats which is a little sad really.

Unlikely I know - but anyone looking to sell a CT2 accelerator
with or without Falcon? I would also consider any other reasonably
stable accelerator.

Wanted for a CLAB Mk-X project. Unfortunately I cant fit a CT60 in
the case without major iron-work for the PSU cooling, etc and dont
really want to wreck the case - I also dont want an external PSU.

Thanks

Ian.

Not even under MINT? Or are you talking a hardware limitation, rather than
just a multitasking problem? Just curious. Thanks.

> every ST computer anyhow, so there should be no problem as long as the user
> has a ST computer. TOS ROM code on the other hand, is copyrighted as that
> is the actual OS which is burned in ROM.

This sounds like the contents of the system disk was not copyrighted
because it was on a disk. The software on the system disks are also
under Copyright. And a TOS comes also with every ST computer.

But the difference was, that there was no official offer from Atari for the
system disks. And it seems, it was allowed to copy some of the system
software (AHDI, ...)

But i think it should be no problem to upload the contents to a
homepage because there is no one who has interest in this software.

In german: wo kein Kl�ger, da kein Richter ;-)

Best regards
Michael

Phantom,
I was looking at some at e-cost.com. I think I found some one time for
like 20 dollars for a 33 mhz 68882. But for a speeder project that Mark D
and I was doing I ended up finding one at http://www.vintagefunworld.com/default.asp
At the time I think I found them under the Amiga link and they were only
16 bucks shipped to my house for a 33 mhz 68882. Works GREAT!!!!

Thanks,

Some CT63 are available...
You should think about a small PSU ATX inside the MK-X case...
It is possible.

Hello,

I have various atari stuff for sale or trade, here's the list:

- atari portofolio package - portfolio, 2x256 kb cards, serial, paralel port, cables, cd with software and games, manual in german, etc..., functional
- motorola mc68060 lc 66 (works at 90 MHz), functional
- midi-3 - c-lab export compatible device for having 3 additional midi outs on modem 1 - with driver for cubase, functional
- a/d converter for converting analog video/audio signals to digital, works with cubase audio very nice, functional
- screenblaster III external, for extended resolutions on falcon with drivers and sotware, last time i used it was working, untested
- TOS 1.06 GER chips, functional
- scsi cable 1.8 m for connecting centronics 50 pin device to falcon, functional

items located in croatia, europe, make offers...

sagan2@net.hr

I wonder if there are freely distributable utilities for WinXP that can
format in 720K. WinXP does appear to read the format well enough...

Except that I am told by a tech aquaintance that some of the newer
drives don't bother checking format and assume that all disks are
1.44k. I do hope he's wrong.

5031. AHCC progression report

Newsgroup: comp.sys.atari.st
Date: 2005-11-22 22:33:31 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <4463$43839cbc$1884f879$12844@news.chello.nl>
Source record: 10206
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

LS

AHCC or ANSI HCC is Sozobon turned into a full C89 compiler
for Atari ST and all its offspring.

I have reached the stage where I was able to produce working
binaries of 2 of my own applications.

These are AHCX and a small spreadsheet program.

I will gradually increase the amount of working binaries
(for instance TT-Digger) and also use them myself.

Once all my own applications work stable I will ask for a small
amount of beta testers.

2 programs working may sound modest, but for me it means
that a very substantial amount of compiler code is actually
working correctly. :-)

It also means that the project starts to display a
shimmer of feasability.

The comprehensive version of AHCC will integrate
editor(AHCX), project manager, compiler, assembler and linker
in a single GEM program of about 350 Kb.

Freestanding components can be produced on request.

AHCC compiles Pure C sources without the need for changing
a single byte.

AHCC produces the Pure C object format which means that Pure C
and AHCC object files and libraries can freely be mixed.
(It made testing the compiler a lot easier :-)

In the future, usefull C99 features will gradually be implemented.

If it isn't alot of trouble, i'd like to have the info on how to do it
correctly.

Also anything on using the Falcon's LAN as a modem port.

I have MAC LAN modem Cables, and some other MAC LAN cables.
Not sure if these will work as is or if they need modified.

And if you know, Is the MegaSTE LAN port exactly as the Falcons?

I have a MegaSTE and would like to use the LAN port for something,
even as a Modem port, just to see how it works.

Do both use the same chips?

5033. TOS 4.02

Newsgroup: comp.sys.atari.st
Date: 2005-11-22 22:38:48 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <L3Ngf.26779$Y82.19236@bignews4.bellsouth.net>
Source record: 10208

Greetings,

I know TOS 4.02 suppose to have some bugs and TOS 4.04 is
suppose to be better.

What were the bugs in TOS 4.02 that were supposed to be fixed
in TOS 4.04?

And will Cubase Audio Falcon work correctly with TOS 4.02?

phantomm@bellsouth.net

5034. Source for 68881 and 68882 Co Processors

Standard RS-422 port.
>

A maclan type (RS-422 to RS-232) modem cable is all that is required.
>

Yes it is, same as the TT's as well.
>

You can run a null modem connection on them.
>
> Do both use the same chips?

Yes the SCC chip.

Hardware limitation, IIRC. Because both of the Falcon's serial ports are
run by the SCC chip. Hang on a sec, I am a bit fuzzy on this but it may
have been the serial 2 port and the lan port on the TT030. Might not
apply to the MegaSTE and Falcon. Which is why the Mega has 4 ports the
TT has 5 and the Falcon has 2. Will double check my docs.

Mark

Go the CT60 route.. Use a mini 12v ATX PSU like this

http://www.mp3car.com/store/product_info.php?cPath=21&products_id=67

I don't know the situation with the MKx but if the CT60 fits at all, you
should buy this PSU and CT60 over CT2 ;)

Thanks,
Mark

I'm not an expert, but it says " M1-ATX is a wide input (6-24V) ATX
power supply". It is not very useful only in cars.

I think that a good target would be compiling FreeMiNT (and/or Xaaes ;))

What about C++?

>Thanks!
>
>Guillaume.
>

As promised, I ran the test on my STE (TOS 1.06).

Input frequency was 21943. (theoretical frequency=21942.85714)

I let the program run for 2 minutes (I had a stopwatch handy), and
these are the values after I stopped the test:

Time (1/100 sec): 12018(so I was over by 18 msec!Hope you won't mind:)
Counter : 2616575
Real frequency : 21771.22769
Difference : -0.7821654723

Oops, a bigger gap than yout MSTE then! (BTW: how do you calculate the
'Real frequency'?). Maybe if you changed the mfp synchro every 50 vbls
(1 sec on 50Hz refresh rates) and instruct it to play a bit faster and
restore it to the normal values on the next vbl to compensate for the
delay? I'm sure that it will be hardly noticable

Regards.

P.S. Your programs are amazing :)

I have the equipment to burn a TOS chip with updates.

For example, I was thinking of making a TOS 4.92 chip
if possible.

And change a few things in a TOS 4.04 chip for personal
use.

The only thing I don't have is maybe the correct socket upgrade
for my programming/Burning hardware.

I can get it, but forgot what the name of the type of socket and
chip that TOS 4.04 is on.

Can someone pass along that info.

> Difference : -0.7821654723
>
> Oops, a bigger gap than yout MSTE then! (BTW: how do you calculate the
> 'Real frequency'?).

I have a routine run by the MFP interrupt at the chosen frequency that
increments a value (the counter). When the test stops, I get the total time
and make a division: counter/time tells me how many incrementations have
occured in one second: that's the real frequency. As the Atari timer has a
1/200 precision for start timer and end time, there can be 1/100 sec of
error. That's why I asked you to let it run two minutes to limit its effect.
In fact, your total time could have been from 120,17 to 120,19 sec and
thus, your real frequency from: 21770 to 21774 Hz. Far enough from the
expected one.

The problem is that I suppose that the 1/200 timer is Ok...
Anyway, thanks for your contribution, anyone else for this little test?

Guillaume.

Source record: 10227

I just bought a Mega STe, with a small internal HD. I've got a 4 gig SCSI drive that I would like to swap out. The original drive has Atari's AHDI driver on it, the 4 gig has HDDriver v8.15 or so.

Is there any reason why I just can't swap (physically) hard drives out?

The 4 gig HD has been formatted and run under TOS 1.04 while, of course, the Mega STe has TOS v2.06.

Thanks!

PS The Mega STe is nice! Built like a tank. :-)

In order to access more than the first GByte of this drive you need an
ICD compatible host adapter. With the original MegaSTE adapter you
cannot access more than the first GByte of a SCSI drive.

Hi Uwe! Thanks for replying.

Hmm, so does one have to disable the internal Mega STe adaptor? If so, how
do you do that? Could you simply unplug the internal hard drive, and plug
up an ICD adapter/hard drive to the Mega STe's ASCI port and go?

Thanks! :-)

The road ahead is to
compile successfully:

my own apps,
a random choice of other peoples apps,
libc,
AHCC itself,
Freemint.

in that order.

AHCC compiles itself (the comprehensive version) on a TT in 9 minutes.

Yes, I think this is the way to go. If you have an external ICD
compatible adapter you should be able to simply connect your drive to
this adapter instead of the internal adapter.

I have been looking for that old TOS Disk that I have.
As I said before, one can use it on a TOS 1.62 STE to run some very
early games and programs that will not work on TOS 1.62.
Crash Garrett is one game I remember that would not work on my STE
unless I booted up the old Tos disk first.

And I am fairly sure that the version of that TOS wasn't pre .99.
It was 1.something. Don't recall the version, but am looking for the
disk to make sure.

It wasn't a System Disk. It was Grey and had TOS in big letters
written across the label.

If I do find it, not sure that I will upload it, if there's a conflict
about
ownership and etc. Even though ever Atari ST program out there
has been copied and put into files for use on PC ST emulators.
Even several versions of TOS on chips were made into images.

I personally don't like the idea of using TOS chip Image Copies
on PCs. Why not just get a ST or STE and use it instead.
But thats my opinion.

Ron,

Depending on how you want to use the Drives, you could use the small
internal
drive as a boot drive and still connect the Larger Drive to the DMA port
using
a ICD Link II/Link 97.

Thats what I did with mine.

And it is probably possible to Boot off the external Drive while having
a internal
one installed. I think ICDs software allows this, Not sure if HD
Driver does.
You may have to use a Setup Disk in the internal disk drive to do that.

I had something setup like this before when using the Spectre GCR
cartridge.
I had a hard drive just for it and booted up that drive only when I
wanted to use
the GCR cart. on the MSTE.

Can this be done with HD Driver Uwe?

Any driver most likely supports this, even AHDI. TOS scans any hard disk drive for an executable root sector and it executes the first executable root sector it finds. Usually the code on this sector then initiates the bootstrapping of the actual hard disk driver.

>instead of correctly shutting it down, but journaling ensures that the
>file system is always consistent.

True, but if you just shut the computer down, you cannot get it to boot into
the system unless you or the system runs some program that checks and/or fixes
the partition.

No there is not reason why you cannot do this. I just it last month with my Hades. I swopped out my old Maxtor 2.5 gig drive for a Western Digital 80 gig drive. You just have to make sure you backup your data and can be able to put it back on your new HD.

C# is a very nice language, are you thinking about compiler or a
interpreter/VM?

Hmm, if I just hooked it straight up, without disabling the internal hard
drive/adapter though, I'd lose the partition scheme on the external hard
drive, right? I mean, there can't be more than one "C", "D", etc, etc,..

Thanks.

Wow! Congratulations! :D

> Once all my own applications work stable I will ask for a small
> amount of beta testers.

I am interested in beta-testing! However I only have a few personal C
sources ; I prefere assembler or higher level (read garbage-collecting)
language like Java.
But if there already is a minimal libc (or perhaps PCSTDLIB already
works ?), I may try it on a few command line utilities I would like to
port (GNU stow, patchutils, robodoc and things like that).

Also also getting the gemlib, zlib and some other key Pure-C librairies
to work could lead in cascade to some interesting builds like...
HighWire! ;)

> The comprehensive version of AHCC will integrate
> editor(AHCX), project manager, compiler, assembler and linker
> in a single GEM program of about 350 Kb.

That's in itself quite a achievement!
<whining>
However it's sad there is not source-level debugger (yet)! ;P
And I think my eyes and I cannot use a programming editor without
syntax highlighting any more!
</whining>

> Freestanding components can be produced on request.

That's really much appreciated: I think a separate assembler could be
put to good use if it support Motorola-syntax and 68020+ instructions,
as there is currently no more still-developped assembler expect GCC's
gas... But as it is intended to compile pre-processed C source code, I
guess there is no internal macro-language (INCLUDE, MACRO, REPT and the
like), "just" cpp?

> AHCC produces the Pure C object format which means that Pure C
> and AHCC object files and libraries can freely be mixed.
> (It made testing the compiler a lot easier :-)

It's also nice of you to be modest enough not to invent your own
format!

Once again congratulations for your work and tenacity,
Guillaume

P.S.: And once more if you have written/found a doc on the Pure-C
object format, feel free to share it! ;)

5068. CCAG Show December 4, 2005

CCAG Show Rescheduled to December 4, 2005

As some of you may be aware, we are allowed the use of the National Guard Armory in Lorain, Ohio because one of our committee members is a member of the National Guard. This allows us to hold this event very inexpensively and free to vendors and attendees. In order for us to hold CCAG at the National Guard Armory in Lorain, he must attend the event. Unfortunately, Hurricane Rita activated the National Guard unit that he is in which meant he was unavailable for the now previously scheduled event date of October 22, 2005.

We have rescheduled the show to December 4, 2005, and have announced it via our email mailing lists and on this website.

It's a long time since I owned, or even used, an Atari.

But I have been tidying and find I still have a lot of software. Before I bin it, would anyone like any items.

Free, except for postage. I don't mind sending things internationally (I live in London, England), but please note that postage on some of the more interesting items may be large even internally as they have big manuals.

All software either has a serial number, or does not ned one.

The most interesting items are

Calamus SL (I believe one can actually upgrade to the latest version at a reduced rate once you have this copy)
Outline Art
Invision Elite
Easydraw 3

Akso

ImageCopy 4
Superbase Personal
NVDI 3
ConNect (demo version only)
Freedom
Selectric
Kobold
Bitmap View
Gem Spooler
Gemview
GSZRZ
HSModem
Idealist
LetemFly
Edith (text editor)
Marcel (word processor)
TextStyle
That's Write (not sure if this needs a serial number)

Also items whose serial number I should have somewhere but haven't yet found

Ease (desktop)
MagicMac
NVDI for MagicMac

I am happy to give more information, but as I can't actually run these
programs I have to rely on what is printed on the disks or in the manual
to get version numbers, dates, etc.

Hi Ronald!

RJH>I'd lose the partition scheme on the external hard drive, right? I
RJH>mean, there can't be more than one "C", "D", etc, etc,..

Well, provided you've got four partitions on each disk, you'd have the partitions of the hard drive with the lowest ID (or first in the row with HDDRIVER) as C through F, followed by partitions from the next hard drive as partitions G through J. So, if some config files are pointing to absolute paths, and not relative or $home, those would have to be altered. For everything else, the actual drive letter of where the data is doesn't matter. Well, with one exception: MagiC has got to be booted from the same drive letter it has been installed on.

With best regards
Ekkehard

Any Pure C builds of Pure C replacement libraries can be used with
or without translation.
A library compiled by Pure C can be published under the LGPL
Once they are compiled by AHCC, the licence can progress to GPL.

Original Pure C libraries can be used by legal owners of Pure C.

> And I think my eyes and I cannot use a programming editor without
> syntax highlighting any more!

AHCC can display C keywords in bold.
You can always use another editor in combination with
the seperate components of AHCC.

>

AHCC compiles C or S on equal terms. There is no intermediate
assembly stage between C and O.

AHCC can mix C and S on the function level where assembly code can
address C declarations.

Assembler and compiler are not separated, the latter makes heavy use
of the infrastructure of the compiler. I didnt want to repeat
usefull code (like the preprocessor ;-).

But as it is intended to compile pre-processed C source code, I
> guess there is no internal macro-language (INCLUDE, MACRO, REPT and the

The assembler will have all the features a good assembler should have.

I write clean app's :-)
If TT-Digger works with Aranym, AHCC will sure do the same.

My Aranym stopped starting up after I switched Suse's.
Havnt got the time to figure out why.
Should probably upgrade to 0.9

AHCC should look like working instantaneous with Aranym-jit
on my 2.8 GHz Linux box.

I still prefer good old TT for Pure C development
(uncomplicated single TOS, reset in 3 seconds :-)

Source record: 10153

Hello,

I picked up a Mega STE and a 1040 ST today at a good will, but sadly they didn't come with a monitor. I don't care if it is monochrome or colour, just as long as it allows me to reach the maximum Mega STE resolution (i believe this is 640x400?), as I will be using the machine to run music programs.

I want to find one in Ottawa, and I will be able to pick up anything I can get.

Thanks a lot!

- Peter

Well can't help from Melbourne;-). However, if you want 640x400 you will need either a Mono monitor or a VGA monitor. It is possible to build an adaptor to allow an ST to run mono on a VGA monitor.

There is an important difference between the Hades and the Mega STE: The
Hades has a completely different SCSI interface. You may be able to
connect an 80 GB drive to the Hades, but this does not mean you can do
the same with the MegaSTE. As already mentioned limitations apply if you
want to use the internal host adapter.

The drive IDs are in no way hard-coded. Partitions on the drive with the
lowest SCSI ID start with C:, and then the drive IDs will be assigned in
ascending order, including any other drive. In other words, the
partitions on the external drive will not be C:, D: etc. anymore but
something like G:, H: etc, depending on how many partitions were found
on the drives with lower IDs. There will just be a shift of IDs.

I made two more tests:

Theorical frquency: 21942

MegaSTE alone, boot from floppy: 21777
MegaSTE +HD + CD : 21843.

The interruptions are sensible to the environment.

Guillaume.

5087. [ARANYM] Need testers for partitioning a disk image

Newsgroup: comp.sys.atari.st
Date: 2005-11-25 18:16:18 UTC
From: Patrice Mandin <pmandin@caramail-NOSPAM.com>
Message-ID: <pan.2005.11.25.18.16.15.861340@caramail-NOSPAM.com>
Source record: 10163

Hello,

I am currently writing a HOWTO to configure ARAnyM from scratch. I just started trying some various hard disk drivers to partition a hard disk image. I tested HDX (Atari), Cecile and CBHD. At the moment, only Cecile reaches the end of the operation.

However, I don't have HDDriver (demo does not allow partitioning) neither SCSI-Tools to do this test. So, if anyone has either of these drivers and an ARAnyM setup, could he make the test and mail me the result (or post it there), so I can add it to the HOWTO.

Here is the in-the-work HOWTO (sections 5 and 6 for hard disk images):
http://www.sophics.cz/cgi-bin/viewcvs.cgi/*checkout*/aranym/doc/aranym_from_scratch.html

Rodolphe, What size PSU is needed with a CT60 and drives(HD & CD)?
I've been looking at these mini itx PSU's..

http://www.logicsupply.com/default.php/cPath/40_65
The "morex" PSU' 80 Watt to be exact.

Thanks,
Rob

Well Peter I would just either order one off the net (Lots of people are selling them cheap or just get one from places like Best Electronics) or just buy a VGA adapter. This adapter allows direct hookup from an Atari ST to a VGA monitor, but will only give the monochrome mode.

No, you can get one of those with an external DC 12v psu for house input.
Thin clients use a similar solution with Mini ATX boards. It's a common
solution and relegates much of the PSU out of the case.

Thanks,
Mark

Rob,

I remember someone measuring their falcon and it used something like 45 watts. Whatever it is, one of these Mini ITX jobs should handle the load no problem, presuming you don't have 500 drives. If you do, just get rid of em all and get a recent 40gb ide (which will be silent compared to most of the sub 10GB scsi/ide disks we all use). That's what i did and I'm sooooo glad I made that decision.

Thanks,
Mark

Hey. Thanks for the reply. How did you hook up the internal drive? I mean
you didn't use the internal (stock) Mega STe adapter right? Otherwise you
would only get 1 gig of that 4.5 gig drive.

Thanks.

Hello, Everyone. I have recently moved and my Atari ST won't read the external hard drive. I'm rusty on the Atari. Do I connect to the HD(external) "IN" or "OUT" ? The external HD makes noise when I turn it on, but it doesn't seem to be as loud as before. I've tried installing an external disk from the Atari options menu, but that didn't work either.

You might say I need a lot of help.

Thanks guys

Jo

Ahem...

Yes, there *is* a game called "HItchhiker's Guide to the Galaxy".
Separately, there is *also* a book titled _Hitchhiker's Guide to the BIOS_.
The title of this book is most certainly a play on the title of the game, or
of the scifi book that preceded it.

Connect DMA from Atari to DMA in on hard drive.
First start hard drive, wait 30 sec, start your st.

Ah. Thanks for the info. I guess I'll have to look it up. I'm supposing
its a guide to BIOS use, but nothing actually to do with the original game
or book or film...

Thanks.

Hey Steve,

I've got a MSTe and a Link 97,

Are you using the Link 97 with the MSTe's DMA port on the back?

If so, Do you have the internal hard drive controller dis-connected
from the
motherboard or is it connected with no hard drive connected to it?

I've haven't used the Link 97 before, been using a Link II.

My Link97 came with German docs, and my German isn't too good.

The Link 97 has a 50pin connector and two DMA ports, correct?

I am assuming one uses the 50 pin connector to connect to hard drives.

And one of the DMA ports connects to the DMA port on the MSTE?

If this is correct, what is the other DMA port for? (For other hard
drives?)

Or do I have it wrong?

From: Phantom <phantomm@bellsouth.net>
Message-ID: <VRoif.10932$KP1.6041@bignews5.bellsouth.net>
Source record: 10186

Greetings,

Recently got a STacy and was wondering if anyone has
taken one of these apart?

I was thinking of putting in a larger internal hard drive.

Are there any problems with taking a STacy apart and
anything I should watch out for?

Also, should I take it apart with the Top Case facing Down or
Up?

And are there any other upgrades one can do to a STacy,
like the TweetyBoard upgrade, TOS 2.06 upgrade, and or
any speed upgrade?

Also, is it possible to replace the Mono LCD Screen with
a Color one?

If one can connect a Color LCD Screen, would TOS reconise
the Color screen automatically and boot up in a Low or Medium
resolution?

I suppose there is no graphics card one could use, unless a
Panther Graphics Adapter would work in one. I have 2
of these adapters and a graphics card to go with one.

If by some way I could get the Panther Adapter connected with
a graphics card, would it then be possible to use a good Color
LCD Screen that supports 640x480 if I could find one that would
fit in place of the stock STacys Mono LCD screen?

Hey everyone,

Just wanted to let you all know that I just put up an auctin for a spare 1040STF I have. It will be shipping from Ottawa, Ontario, Canaada. Local pickup will also be available so if anyone here is from Ottawa this could be a good auction for them.

The system is in gorgeous shape, and it includes an atari branded mouse.

Thanks!

The Hitchhiker's guide to the BIOS documents the Atari ST BIOS. It's nothing to do with games. I Googled for EmuTOS, as suggested, and located a copy.

5117. Re: Atari ST Hitchhiker's guide to the BIOS

Previously, when I Googled for "Atari ST Hitchhiker's guide to the BIOS," I couldn't find a copy of the document that I have a paper copy of.

I still haven't found an online copy of the ST BIOS print out I have. It includes files called init.s and others (sorry, I don't have the names to hand at the moment).

5121. Mega STE serial ports?

Newsgroup: comp.sys.atari.st
Date: 2005-11-28 13:59:58 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.11.28.13.59.58.624466@charter.net>
Source record: 10198

Hey guys - I was just playing around with my newly acquired Mega STe. I was in Xcontrol, diddling with the Serial port CPX. It does show the extra ports on the Mega STe, but I couldn't get any of them to go past 19.2k. I thought that a couple of those ports used a better chip and could go much faster than that.

Thanks.

Source record: 10102

Hey guys. I have a question. I've been bidding on some games from the UK. I always thought that basically you could run any ST game anywhere, as long as it didn't have problems with the TOS version/machine you were running it on. I mean, I thought that, for example PAL/NTSC games would work on either PAL or NTSC machines, albeit with some differences like a slight speed increase/decrease and slight screen size increase/decrease. In worst case scenarios, you can run a 50mhz booter prg. for some games.

Is that assessment not accurate? I'd hate to think I was bidding on software that I just can't use! :-)

Thanks everyone.

IIRC the CPX's don't work correctly, and will not go past 19,200. The
CPX is worthless anyway. What you need is a comms program that will talk
directly to the ports. Connect or Stalker will do the job.

Hmm I have that TOS disk and mine is not TOS 1.0 but a different TOS. It has a green/white patterned backdrop kinda like TOS 2.06. It is a early TOS for the early 520ST computers with a date of 1985. If you find it let me know and I will upload it.

No the point I am making is that the disks are not the OS, the TOS is. So to copy the disks you are not copying the Operating System. But in either case I am sure Atari does not care if we offer someone a copy of a Language disk for a 20 year old Atari 520ST computer they bought for $2.99 at Goodwill. :P

Yes, but i was expecting the contrary: closer to the theorical frequency wihtout HD and CD. And, actually, if you remove the peripherials, the interruptions seem to work worse!

Guillaume.

5137. An emulator that can run Snacman?

Newsgroup: comp.sys.atari.st
Date: 2005-11-29 16:32:52 UTC
From: squelch41@hotmail.com
Message-ID: <1133281972.567634.164950@g47g2000cwa.googlegroups.com>
Source record: 10113

Hi,

I have an old atari ST shareware program called SnacMan. I cant find
any PC emulator that can run it properly. Does anyone have any ideas?
Tried Gemul8r8, STeem. The closest was pacifist but as it is DOS, it
wont run on my new computer!

Cheers
squelch41

I could play Snacman on Steem(v.3.2) w. Tos 2.06 and 4MB of RAM. I downloaded the game from Atarilegend.

Yes, I've taken it apart, on my homepage (link, see below) there's an article how to put a PAK into the STacy, but it's german only. But you will find some pictures, where the screws are to disassemble the STacy without wrecking it.:-)

Ciao

Great!

Info like this is what I need. I have heard that it can be hard to
take the STacy apart if you aren't careful.

I believe the STacy has RainBow Tos 1.4? Can it be upgraded
to TOS 2.06 if one had a TOS 2.06 upgrade board for a ST to use in the
STacy?

I have a Tweety Board new in the box. Which allows Stereo on older STs.
Will this work on the STacy too?

If anyone has done any upgrades to a STacy, I would like to hear about
there experiences and what was done.

Also, if anyone has a TOS 1.4 to TOS 2.06 upgrade board, do contact me.

Hello Phantom,

> I personally don't like the idea of using TOS chip Image
> Copies on PCs. Why not just get a ST or STE and use it
> instead.

In my case because the opportunity to buy an ST or STE had not presented itself since I moved to the U.S, leaving my STFM behind. I'm keen enough that I would make physical room for one, but I can believe that wouldn't be practical for everyone. I've seen ST emulators used on laptops and even PDAs, which is nice for those of us who lack an ST Book (which wouldn't work well with colour software in any case). An emulated ST can save someone the cost of an ACSI->SCSI adaptor and an external hard disk. I imagine they're useful when it comes to software development too. If copyright is the main concern, EmuTOS makes an interesting alternative to copying Atari ROMs.

Hello Patrice,

The "Howto" looks like a useful document. I would like to help out but ARAnyM does not seem to work on NetBSD for some reason.

I don't have partitioning software, but I should have a text file somewhere that explains quite clearly the ST partition format. Armed with this and a disk sector editor it should be possible to create a partition, or perhaps to write a new partitioning utility. Let me know if you want me to dig up the file.

See page 11 of the BEST catalog, listing both a TOS 2.06
and up switcher board, and the PAK. Yes, they seem to be
available, but to use one with a Stacy you would have to
rack mount it, which sort of defeats the purpose. They
are nice machines, even if you do not have a very strong
lap.

Thanks, but I know the partition root sector. My goal (and the howto's one) is to explain how to get a workable ARAnyM configuration. Like when you first boot your Atari (without hard disk driver to boot from a hard disk), and wonder how to put software on it.

Once you have a hard disk image partitionned and usable from ARAnyM, your virtual Atari machine is on, waiting for you, and the howto will stop there.

PS: I also forgot to list the ICD hard disk driver, does anyone could test it?

>
> Guillaume.
>

Ok, here's my tests with a Falcon030+HD driver (TOS 4.04):

Input frequency was 21943. (theoretical frequency=21942.85714)

Time (1/100 sec): 12013
Counter : 2624587
Real frequency : 21846.98048
Difference : -0.4369379153

Then I re-ran the test with no drivers loaded:

Time (1/100 sec): 12019
Counter : 2626119
Real frequency : 21849.72959
Difference : -0.4244093987

It seems that the Falcon behaves like it should: Turn off the hd
driver and it starts coming close to the theoretical values.

Anyone else to do some tests?

Hi Phantom,

> Info like this is what I need. I have heard that it can be hard to
> take the STacy apart if you aren't careful.
It's only hard the first time you do it.:-)
You have to be very carefull when removing the keyboard, because it's contacted with a little foil that is very, very sensitive. If you destroy it you have a big problem.

>
> I believe the STacy has RainBow Tos 1.4? Can it be upgraded

> STacy?
AFAIR you can only use boards that are attached to the CPU socket, because the ROMs in the STacy are different to that, which are used in regular STs.
But for attaching it to the CPU socket you have to solder out the CPU.

Hi,

> A PAK in a STacy! Way Cool!!!
Yes, it is.:-)
On the PAK board is also a TOS 3.06, so you get all in one. Another solution would be to install a Speeder like Hypercache Turbo+ or something similiar.
And a new harddisk is recommended, the original one is small, loud and slow, but then you have to do some work on the STacy "SCSI" Controller.

> Are the Pak boards still availabe, if so where and about how much
> do they cost?
You will find them sometimes on (german) ebay.

as Andy says, I can't carry my ST around with me but I still like to play
Atari games. With STEEM and a USB game pad I can play meny of my Atari games
on my laptop. In fact as my main ATARI, is a TT030 I can't play them on it
any way:-(

No its not. The MegaSte's serial port is not reliable above 56k, while
the TT's is solid to 230k. I should know, I spent days testing the
ports on the MegaSte, TT, Falcon and various PC's for a serial
networking project I was working on a few years ago.

The chips are the same, what is different is how much CPU overhead is
needed. The 16Mhz 68000 is not able to PHYSICALY sustain these speeds
the the serial ports are. An accelerated MegaSTE would run at full throttle.

You seriously underestimate the power of an 8mhz 68k. The problem with the MSTE's serial port is that the chips ARE NOT the same. Although they are pin and signal compatible, they are entirely different revisions of the same chip. If you lift a SCC from a TT and place it in the MSTE then voila, 230K.

I was just wondering, I have my Wizztronics Falcon case, which I love, but its purely black. Nothing wrong with the color that defines the absense of color/light as we know it, but my accessories around it don't match.

Can anyone offer me some helpful hints/sage advice, etc, etc, for painting the following so they match?:

monitor
mouse
floppy faceplate
CDRW faceplate

I'm using a DEKA interface so I've got the black keyboard part covered already.

Thanks gang! :-)

5176. FA: Atari 1040ST complete Set with Megafile 30

Newsgroup: comp.sys.atari.st
Date: 2005-12-03 12:34:08 UTC
From: David Mueller <spamspamspam@ea31.com>
Message-ID: <3vdhm1F15bqc1U1@news.dfncis.de>
Source record: 10053

Hi there,

I finally decided to get "rid" of the Atari-Setup I inherited. The Atari began to feel quite lonely between all the commodores :).

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=8728608235&rd=1&sspagename=STRK%3AMESE%3AIT&rd=1

The set includes

- Atari 1040ST
- SM124 Monitor
- SF354 external Diskdrive
- 2 Mice
- Megafil 30 Harddisk
- Various Software (Games, 40 Disks)
- All cables

The Atari itself is in working condition, the Megafile I don't know about, I did not know how to test (as I said, I'm more into Commodore-Stuff).

I'll ship anywhere, as long as the buyer pays postage :). Shipping to Europe (most countries) would be 32 EUR

Dave

(if you have questions, email me at david.mueller@post.rwth-aachen.de)

5179. TeraDesk 3.70 released

Newsgroup: comp.sys.atari.st
Date: 2005-12-04 13:03:43 UTC
From: vdjole@EUnet.yu
Message-ID: <dmupfd$6ke$1@news.eunet.yu>
Source record: 10056

Version 3.70 of Tera Desktop (TeraDesk) open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit
and 32-bit Atari computers. Developer's goal is to maintain TeraDesk as
a small, simple, fast and reliable desktop, which can run on any TOS-
compatible Atari computer, clone or emulator and which can be be functional
and competetive in the modern multitasking environments and all flavours
and versions of TOS-compatible operating system(s), while keeping, as
much as reasonable, familiarity with the original TOS desktop.

Several new features have been added since the last published version, some
of which have often been asked for by the users (e.g. the 'autoselector').
Also, a number of bugs has been fixed.

Users are advised to read the documentation before running the program ;)
Some features of TeraDesk may not be immediately obvious.

Have fun.

5180. GT-Look II 2.11

Newsgroup: comp.sys.atari.st

From: LAFABRIE Florent <florent@lafabrie.net>
Message-ID: <43930f1a$0$18578$7a628cd7@news.club-internet.fr>
Source record: 10057

Hello,

By disassembling the software GT-Look II 2.11 I noticed that the
software seeks with the launching of the files to format LMD:
DAP_OUT.LMD and FILTER.LMD. They obviously make it possible to activate
the menus Filters and Print of GT-Look II. My deutch version 2.11 does
not have which it and in spite of my research on Internet, I did not
find anything. Would somebody have that with his version? They would
also seem that they can be put in a file Modules (a little as with Daï¿½s
Picture). If somebody has a version into Englishï¿½ Thankï¿½s by advance.

I'm trying to identify the name of a game I saw on an ST many years
ago -

I think the game may have been french
The game had a sort of static screen with a very weird alien and
as I recall very odd digital voice giving instructions on how to proceed.

The weirdness of it is what I remember most - I don't think I ever
saw anything else like it

I know thats a bit vague but does it ring any bells with anyone?

Hi,

> By disassembling the software GT-Look II 2.11

Did you plan to write a replacement or additional modules if you do such
a work?

> My deutch version 2.11 does not have which it and in spite of my
> research on Internet, I did not find anything. Would somebody have
> that with his version?

I cant help. My version 2.11 also has no additional modules. Maybe only
the base software was set to freeware and not additional filter modules?

Regards
Michael

5185. ARAnyM Question

Newsgroup: comp.sys.atari.st
Date: 2005-12-05 20:38:11 UTC
From: Glenn <noemail@nospam.com>
Message-ID: <Ty1lf.12747$5V1.4671@trnddc02>
Source record: 10061

Was wondering how ARAnyM stacks up against MagicMac/PC? Mainly in the area of ability to connect Atari ST/TT/Falcon hard drives (e.g. Syquests, etc) through a SCSI connection and be able to read the AHDI partitions and extract files.

Would like to do this on the PC. MagicMac seems better at doing this since SCSI is better supported on the Mac platform as oppose to the PC.

Thanks,
Glenn

These SCSI peripherals are obsolete ... We need to take account of
FireWire or USB peripherals, which is perfect with Macs ... ARAnyM
is not an emulator, and backward compatibility with old peripherals
is not the main point. ARAnyM is a new ATARI platform ...

Do you understand ?

Hi, been a while since I got any decent demo's. Any recommendations? I have all flavours of Atari (XL/XE, STFM/E, MegaSTE, TT030 and Falcon). Recent discussions on comp.sys.atari.8bit have reignited my interest.

Thanks

Mark

The only people I know of that have used an ET4000 graphics card are Hades owners. You may want to go to Lonney Purcel's website and look on his list of Hades/Milan owners and see which ones have that card installed. I use a Nova card, but I do have the driver on my hard drive for the ET4000.

The Snowman demo is a real good one for this time of year. It runs off of a disk and is about 800k. Has excellent digital sound.

on XL/XE try 'Numen', bu you'll need mor then 64KB to do that.

5194. ET4000 Graphics Card

Newsgroup: comp.sys.atari.st
Date: 2005-12-06 09:12:24 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <Fzclf.55534$s92.53956@bignews6.bellsouth.net>
Source record: 10069

I have a ET 4000 Graphics Card that came with
2 Panther Graphics Adapters.

No one has been able to give me any info on the Panthers yet,
so I was wondering if there is a way I can use the ET 4000 Card
on a MegaST4 or MegaSTe or other Atari ST computer?

I don't have a VME adapter for it, but I do have a old VME Graphics
Card for the MegaSTE called the AlberTT.

Now, does anyone know if the VME part can be removed from the AlberTT
and
connected to the ET4000 and then plugged into a VME BUS on a MEGA STE?

Or some how get it to work with a MegaST4? I'd really like to get it
working
with the MegaST4, or 1040STE. If I had some info on those damn
Panther Graphics Adapters. They have some extra ICs, about 3 that I
have no idea on where they go. The board seems to connect to the
68000 socket, and has a socket on top for the removed 68000 chip.
Also cables that run to the ET 4000. But have no idea where those
3 ICs go or if they are even used.

Someone out there must have used one of these before???

Really could use some help or advice.

phantomm@bellsouth.net

> Don't listen to that nonesense, it runs on top of windows, linux or what
> have you, "ARAnyM is an emulated ATARI platform" ...

I know this is religion for some, but..

Personaly, I think it's more like a virtual machine, since it doesn't really emulate an existing machine (only parts of the F030 are emulated afaik). I think it's a really nice approach, since it would cost too much cash to design a "real" machine with the same specs (well, it isn't possible at all since we have no 1ghz+ 68k CPUs..).

They've implemented some really neat ways of using native (non-emulated) hardware from the host platform too.. Naturally, it's not compatible with hardware banging stuff, but on the other hand, a "real" clone isn't compatible with such stuff either..

regards

I guess this issue can be debated back and forth forever. Personally, I simply decided I don't consider a virtual machine to be a valid upgrade path for me personally. In fact, I don't view it differently than any emulator in any way. Other may disagree, but having to run on a host OS with MiNT/TOS needing a CPU emulator in order to keep ticking, that ain't acceptable for me.

If it can keep a few Atari users/developers from abandoning the platform however, that is all good though. As long as software is not written explicitly for it, there should be no problem.

I agree 100% with Lonny here. Aranym is no less an emulator than any
other.

This is all fine, as long as these things are kept out of "our"
operating systems, like FreeMiNT. The right way to support this is via
drivers.

Hi,

>>>Don't listen to that nonesense, it runs on top of windows, linux or what
>>>have you, "ARAnyM is an emulated ATARI platform" ...

Yes :) And it is not an "emulated ATARI (existing) machine" :) So it is
not an emulator, it is a new (virtual) machine, and also an ATARI
platform. I agree a 100% :)

> I agree 100% with Lonny here. Aranym is no less an emulator than any
> other.

Do you run DHS 68060 demos on an emulator, altogether with Gemview, for
instance, that is compatible with the first ATARI hardwares, and not
maintained since about early 90s ?

>>I know this is religion for some, but..
>>
>>Personaly, I think it's more like a virtual machine, since it doesn't
>>really emulate an existing machine (only parts of the F030 are emulated
>
> Virtual machine, emulator .. where is the difference?

Well ... A virtual machine contains an emulator for the bytecode of
the virtual machine. It also has a Just In Time Compiler, and machine
APIs ... An "emulator" is a restrictive way to talk about ARAnyM,
because the goal for its development is not to "emulate" an existing
ATARI machine ;) You may use it that way, but it has much more
potentialities, indeed !

>>afaik). I think it's a really nice approach, since it would cost too

What kind of hardware are you dreaming of ? That is the basic
question that answers to the ARAnyM's goals of developments ...

So ... it all boils down to the fact that all these fancy terms of
different layers of software are there to ultimately accomplish one
goal, emulate a given hardware environment for Atari software? Doesnt
that make it an emulator?

>

Ok .. but it is an emulator? Even if it doesnt emulate a specific
machine, it emulates a given 'range of hardware' so to speak. Only when
the operating system runs native on a given hardware platform it stops
being an emulator. Even if that operating system have to emulate a CPU
to run native applications, as happened when Apple switched to PPC, and
how Morphos now runs old m68k apps. Ofcourse, I take it that agreeing on

this point is never gonna happen, so I think we drop the discussion
agreeing on the fact that we dont agree :)

I very much would like to port FreeMiNT/XaAES to the Pegasos platform.
But I dont know how much interest there would be, because such a port
would mean the operating system would consist of FreeMiNT/XaAES, and
older AES's would not follow onto this new platform. MyAES would most
probably follow, since it is being developed...

ST:

Flipo
O Demo
Virtual Escape
Odd Stuff
Suretrip
Fantasia
Froggies over the fence
Punish your Machine
Cuddly demos....

STE:

Braindamage
Overdose
Necrosys

Falcon:

Hmmm
Undrescore (_)
Obnoxious
Sonoluminiszenze
Scarface
ATS
EKO system

just to name a few.. Warm recomendatios that u get No Fragments CD
compilations. A lot of ST demos and stuff there, all nicely packed etc.
Also it is recent compilation as well.

Well some people may be happy with virtual sex, or emulated one, i am not! Nothing beat real experience imho ;)) So i agree, diference betwen emulater or virtual is unimportant, only real thing matter.. Windows and Macos etc can in this context act as additional layers between flesh: NOT GOOD :)

Then, you get really frustrated for this matter in present situation ;)
If you don't make usage of ARAnyM (virtual) machine. No "real machines"
around ;)

ATARI rules ... Don't dirt the thread, please.

Regardless if we like it or not, any future TOS/FreeMiNT platform will have to include *some* degree of emulation, or we won't be able to run stuff unless we have the sourcecode (and even in that case we run into problems unless the whole shebang is written in C/C++).

For me, Aranym could never replace the feeling of the real deal (I have a CT60 too), but it's the only way of having a fast (semi) TOS-laptop.

ARAnyM can use any device supported by the host OS. Just read the
documentation. But to be on safe side, you'd better make an image file
from your SCSI hard disks before trying them with ARAnyM.

> Would like to do this on the PC. MagicMac seems better at doing this since
> SCSI is better supported on the Mac platform as oppose to the PC.

Hardware is the same, whatever the platform, as long as you have a driver
for it. SCSI is no different from that point of view.

PS: At last, you have an answer to your question :-).

Sorry? That did not make sense.

The bottom line is that when the Atari ST computer was purchased, it came with a copy of the system disk in the box. So if you now own the machine and do not have the disk, you are still entitled to that disk. I don't even think this sofware was licensed as it is not even a Operating System! I don't even think it's against the law to get a copy of the disk, if you own the actual ST machine with TOS inside it. Because the disk came with the machine to begin with! Does that make sense? It does to me.

Your knowledge is correct here: NVDI5 always was sold complete with the
ET4000 drivers (that were sold as a separate package in earlier ver-
sions, I used to run "NVDI3 ET4000" on my TT030 until I sold it, e.g.).

Thus, the Tseng Lab ET4000 chipset is the best supported one on the
Atari.

HTH,

Thorsten

Thanks for the answer.

My main intent is to be able to move files from old drives and get them archived onto CDR or DVD+/-R. Trying to do this on an older Mac and get the files moved over to a PC can be a real pain. Just trying to simplify the process.

Regards,
Glenn

> that make it an emulator?

There are a lot emulators for ATARI platforms. Some of them are
designed for games, other for GEM compatibility etc. They are taking
account of precise TOS versions and want to be as closer as
possible to the original hardware, for the resolutions, the clock
frequency etc. Don't tell me that you don't know them ! I personally
helped to developments of STonX and TOSBox, for instance ...

What is the interest of the JITc on an emulator, that gives 20 times
the speed of a Hades 60, if we want to emulate a Falcon 030 running
at 16MHz to play games ?

What is the interest of a Unix host filesystem, if we want to
run ATARI games located in diskettes MSA archives ?

If you don't know what is an emulator, then use them if you have
the usage of those, and stop calling ARAnyM an emulator. It takes
advantage of the most recent hardware and peripherals to build a
(virtual) machine hosted by the most recent OS and technologies.

It takes advantage of the most recent machines and OSes to make
it available in an ATARI (development) environment.

Please experiment ATARI emulators to make your own opinion.

>> Do you run DHS 68060 demos on an emulator, altogether with Gemview, for
>> instance, that is compatible with the first ATARI hardwares, and not
>> maintained since about early 90s ?
>
> Not sure what you are getting at here...

No emulator so far can run CT60 or Hades 60 softwares except ARAnyM.

And it runs them perfectly 20 times faster or more ! What is the
interest to play to PacMan game 20 times faster ? You couldn't be
fast enough to handle the game at this speed. This powerful speed

is the way to build new applications etc. To use hardware OpenGL
cards that didn't exist for previous ATARIs, using host system
drivers etc.

Are you so naive that you don't know that many technologies have
evolved since the latest ATARI hardware were produced ?

>> Well ... A virtual machine contains an emulator for the bytecode of
>> the virtual machine. It also has a Just In Time Compiler, and machine
>> APIs ... An "emulator" is a restrictive way to talk about ARAnyM,

>> potentialities, indeed !
>
> Ok .. but it is an emulator? Even if it doesnt emulate a specific
> machine, it emulates a given 'range of hardware' so to speak.

It runs the whole 68k family instruction set. It neither emulates
an ATARI machine, nor a precise ATARI (Motorola) processor. It is
not an emulator. It is a virtual machine !

> Only when
> the operating system runs native on a given hardware platform it stops
> being an emulator.

Then would you call Java (or .NET) emulator, because there's no
Java machines ? Virtual machines have now the power of the hosting
machines, thanks to JITc mainly. No hardware platform required
for those !

> Even if that operating system have to emulate a CPU
> to run native applications, as happened when Apple switched to PPC,

This was an emulator. Not a virtual machine ;)

> and
> how Morphos now runs old m68k apps. Ofcourse, I take it that agreeing on
> this point is never gonna happen, so I think we drop the discussion
> agreeing on the fact that we dont agree :)

Because you're wrong. Not enough knowledges about what you're
telling about.

>> What kind of hardware are you dreaming of ? That is the basic
>> question that answers to the ARAnyM's goals of developments ...
>
> I very much would like to port FreeMiNT/XaAES to the Pegasos platform.

It won't run without ARAnyM that is a portable ATARI platform.

You may be rather interested by a development environment that allows
you to port your applications, rather than a virtual machine like
ARAnyM that runs independently from the hosting OS and hardware.

> But I dont know how much interest there would be, because such a port
> would mean the operating system would consist of FreeMiNT/XaAES, and
> older AES's would not follow onto this new platform. MyAES would most
> probably follow, since it is being developed...

Yes ... You're speaking about portable development environment.
That has nothing to do with the principle of the virtual machine.

>> What community are you talking of ? Don't you think that "we" are going
>> the same way ?
>
> I dont really understand what you mean here either ... :)

You are speaking, if I understood, of the ATARI OS (freeMiNT). I'm
speaking about the ATARI virtual machine (ARAnyM). We need both to
go forward ... We are going the same way :)

Hi Francois!

> To use hardware OpenGL cards that didn't exist for previous ATARIs,
> using host system drivers etc.

Thats all very nice and stuff, if only aranym did this really really well, but unfortunately this is not the case. Undoubtedly it has made a lot of progress and for the first time in years I have acutally been able to use it.

But I have stopped again, since there are too many bugs. Too many layers of software are messing it up.

LibSDL has bugs, fvdi has lots of bugs and features missing, aranym itself has bugs, the host file system driver is incredibly slow (as I have shown on the aranym mailinglist), the overall handling of aranym is still a bit sloppy compared to e.g. MagiC-PC.
Another cool feature would be: save/restore state so u dont have to reboot.

But aranym cant even shutdown mint properly here, well, it might do so without fvdi, but whats the use of aranym without fvdi?

I could extend my list of deficiencies and shortcomings probably forever! There are so incredibly many sources of bugs and flaws (and not all of them come from the aranym dev team at all).

Dont get me wrong, I am not saying aranym is crap. Not at all. But its nowhere near you claim it is. All I am saying is that it is very far from being usable as a stable and reliable environment.

I have been following aranym almost from its start and never have I seen a stable release of it.

And that is quite a difference to real hardware:
All the Atari clones I know are working very reliable. My Milan has uptimes of weeks, while with aranym I am really happy if it runs for an hour.

So my opinion is this:
Before any new features are added to aranym, there has to be a huuuge betatest phase with a looot of bugfixing and polishing up.

And when that day finally comes, then aranym is a good thing, but for now it is unfortunately no more than a nice tool I can play around with for a bit and say:
Hey, sweet, but thats it.

Cheers, Ingo =;->

> of ability to connect Atari ST/TT/Falcon hard drives (e.g. Syquests, etc)
> through a SCSI connection and be able to read the AHDI partitions and
> extract files.

I have connected my real Falcon IDE disk tomy PC, started aranym and it
directly read it. So if you are really just looking for backing things
up, I guess, aranym can do a good job for you.

But I wish you good luck setting it up and hope you dont experince
crashes. The best thing you can do, is make a disk image, e.g. with dd
command under Linux.

Be very careful with the dd command as it can destroy entire disks easily.

> Would like to do this on the PC.

In this case,the best thing is probably this:
Start Linux. If you dont have Linux, get a live CD (e.g. Knoppix) and
then make an image of your harddisk. Then try playing with aranym.

> MagicMac seems better at doing this since SCSI is better supported
> on the Mac platform as oppose to the PC.

Not sure if I would trust MagiCMac so much,it is pretty buggy. But so is
aranym, but with aranym you can use a disk image and thus not do any
damage to your real data.

Let us know, if u have trouble setting aranym up, I am sure we canhelp.

Cheers, Ingo =;->

I agree that 'emulator' is too rude a word for Aranym.

I like to talk about Aranym in itself as a machine.
Like: "I have a 2,8 GHz Aranym next to my dear old TT030"

Nevertheless, something has to be done to make Aranym
execute a certain codebase on a machine that wasnt designed
for it.

Aranym needs a microcode for each hardware not able to
execute the codebase.

It is very dificult to avoid talking about this question
by avoiding certain words.

I would suggest to use the words 'microcode' or 'execution machine'
in stead of 'emulator' and 'execute' in stead of 'emulate'.

lp,

This is probably the one of very few things that you and I disagree on, nonetheless... ;) IMHO Aranym is an Atari machine. Many people left on Atari are doing live development on Aranym. While it has limitations like need to test on real hardware, etc, it's very useful to create another machine with the power of the CT60 on the cheap. It's also good in cases where we don't have a good video card for the falcon/ct60 *still*. You can say, oh it's just emulation, but in my opinion, it stands out as a virtual machine. The difference being that host hardware is used for audio, instructions being translated with JIT, native partition files able to be used, native host ethernet, native host filesystems, etc. Because of the layout and design, the host machine is an extension of the atari system, therefore it's much more than just an emulator (which is quite the self-contained beast). To users who want to work on freemint, etc, or develop Atari software but don't want to sink any cash into building up a falcon for themselves, aranym is a path and a surprisingly good one at that.

The only real complaint is that some major aranym devs have in the past touted aranym as the way of the platform. I call BS on that. It's just a very very superb tool. I think they have since retracted those statements too, but can't be sure either way. And anyway, that confidence is a good thing ;)

Thanks,
Mark

This is a very sensible answer :)

> They've implemented some really neat ways of using native
> (non-emulated) hardware from the host platform too.. Naturally, it's
> not compatible with hardware banging stuff, but on the other hand, a
> "real" clone isn't compatible with such stuff either..

We won't stay here, crossed harms waiting for the new hardware to come.

The way ARAnyM started was to ask ATARI peoples what type of new machine
they were dreaming about. Peoples were all dreaming of a brand new
PeCes, with all modern peripherals. I had a Hades 60 at this period,
and I answered asking me what could be improved on my machine ... All
was almost there on the Hades.

Then, why not to implement a virtual machine on every kind of OSes and
hardware, that would be independent from the host platform ? This was
the answer. Because I first helped for emulators like STonX and TOSBox,
I guessed it was a really good idea ... I had no conscience of what was
a virtual machine, but I thought at that time "whaaa, I've never seen
such a powerful emulator !". It was then adapted to Cygwin and OSX, and
I really began to realize what was the power of a virtual machine.

Now peoples can think it is not enough reliable, unstable or bugged etc.
If you followed the project from the beginning, you would see what piece
of work has been done on it :) And it is GNU GPL, with no facilities of
big majors like SUN or Microsoft that already have their VM ;)

I wouldn't tell it's the ultimate solution ... Other software or
hardware projects are going on at the same time. But it is the project
that gave quicker results, with a lot of consequences in the ATARI
world.

So, enjoy it, and make it leave :)

Regards,

> falcon for themselves, aranym is a path and a surprisingly good one at
> that.

Virtual machine is NOT an emualtor as long it "virtualise" a non existant machine, as soon as virtual machine "virtualise" existing machine it emulate that one, so how we should call it? Problem is: Aranym dudes and fans goes berserk if we call Aranym emulator or when we say its not an Atari. Noone say Aranym is crap, we know what it is and what it can do, how fast is, etc. We also know that Apex Media snapshoots are fake, since if program does start, but then crap on 90% of options and things it SHOULD do is misleading.. But okay, we cant deny it starts! Still Aranym comunity will not stop until we will say that TT ot Falcon are crap and not Ataris since Aranym IS real Atari..

Aranym use native host hardware, instructions are translated (eg emulated, simulated, virtualised all u want just not EXECUTED), hardware is either host hardware OR simulated, translated, emulated, virtualised, whatewer (VIDEL for example) and also depends heavily on underlying OS, so "ATARI" OS calls are again translated, virtualised, simulated, emulated on oh so many layers.. Now where "It is an Atari machine" comes from? What can for example GEMDOS $39 (makedir) do on Aranym without Windows, MacOS or Linux? Absolutley nothing.

Hello,
Currently, I translate GT-LOOK into French. I read on an old message
which one could have the modules on the site of www. milanstation.de,
but I did not find anythingï¿½ GT-Look is freeware, for the modules, I
doniï¿½t know. I wrote several months ago with the authors without having
answer.

Hi Glenn!

I would like to get to the roots you were asking for. ARAnyM uses the host OS to access the HDD. So you are able to read whatever Atari formatted HDD you have the bus for on your PC and your host OS (Linux, or Windows) is able to see as a device. There is no need for the host OS to understand the filesystem on the Atari disk though when you use ARAnyM.

You can also create a complete HDD image (all partitions including the partition table) and access that image with ARAnyM on your PC. This approach is recommended to not to mess the real HDD data accidentally in case something is wrong with ARAnyM itself.

I hope this helps.

STanda

I found an article in the online archive of the German "ST Computer"
magazine (issue 4/96), claiming:

"Der Einbau der Hardware erschï¿½pft sich im Einsetzen der Treiberplatine
auf oder unter die CPU bzw. Beschleunigerkarte."

Roughly translated: "Adding the [Panther] hardware doesn't exceed
inserting the driver board onto or under the CPU, or speeder board
respectively."

On wrsonline.de, though, are JEDEC files for both the Panther 1 and 2 GALs and an additional instruction to wire pin C1 to C8 on the Panther 1 to make them work: <http://www.wrsonline.de/gals.html>.

HTH,

Thorsten

> Still Aranym comunity
> will not stop until we will say that TT ot Falcon are crap and not Ataris
> since Aranym IS real Atari..

Aranym community... Atari community... How are they separate?

I don't get it. Why does everything has to be black & white on this particular issue? I normally use "real" atari machines; a CT2 and a CT60. They are not crap. A stock falcon is not crap either. I like atari machines. But that's not the issue.

My point is, that if properly configured, this is a good alternative if you *haven't* got a CT60/Hades060. My point is *not* that Aranym should be better than "real" machines, it just happens to be fast and cheap and well implemented (despite some bugs).

In theory, it could be possible to kick the host OS and make the whole shebang run natively (with a lot of work, naturally), but then again, how would we benefit from that? No up to date drivers, inventing the wheel over again, no portability, and it would not increase stability notably either.

LP quoted an on-line dictionary:

>Main Entry: em·u·la·tor
>Pronunciation: 'em-y&-"lA-t&r
>Function: noun
>1 : one that emulates
>2 : hardware or software that permits programs written for one computer to
>be run on another usually newer computer

I don't think I've said that it's not an emulator, only that it's "more like a virtual machine" (or something like that). It is quite possible to compile and run stuff under Aranym which could never run on a "real" machine. In that case, we are not *only* talking about emulation, because in that case, it "emulates" stuff that doesn't exist in the "real" world. It does however emulate parts of the hardware as necessary. I don't think I've said otherwise.

"Virtual machine" is not a sweet word for "emulator". Some people here seems to think this is a way of saying it doesn't emulate anything. That's not the idea.

I strongly suspect this has all to do with how much buffer there is on the
UART. Asking the processor to respond too often to interrupts will lead to
the unreliability described earlier. However, if the CPU is requested for
moving not several bytes but many more, there should be no problem. A
workaround would be to design a cartridge providing a new serial interface,
with UART endowed with a much larger buffer. The usefulness of this in this
day and age remains to be seen though.

5244. Converting 1ST Word Plus documents

Newsgroup: comp.sys.atari.st
Date: 2005-12-11 21:32:36 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <dni5tk$6dr$1@orkan.itea.ntnu.no>
Source record: 9971

I recently found some old disks with lots of documents I wrote in the 80's, all of them in 1ST Word Plus format. I'd like to convert them to a current format like RTF or HTML, even plain text is OK. The obvious solution is to use 1ST Word Plus and export to plain text, but 1ST Word Plus doesn't work on my Milan. Are there any utilities that can do this? Or perhaps another editor/word processor that reads these files?

Message to Uwe

I had a problem with my TT getting stuck on booting, so to make a long story shorter, I ran the Write test part of Discus, and it found a bunch of bad sectors. This is a very old drive. Then I ran HDD sector test, it found no bad sectors, but showed a number of sectors that looked a little strange for a 4 gig drive, and after that it did not get stuck in the middle of a boot process.

What did I do?

It crashes on my Milan if I try to import a 1ST Word Plus document. I have
Papyrus 7.5, perhaps I need a newer version?

What do you mean by "looked a little strange"?
As far as the sector tests of DISKUS and HDDRUTIL are concerned the
algorithms are different. HDDRIVER makes a a read test only, whereas
DISKUS, depending on the settings, also makes a write test. The results
if these different test approaches can differ.
In general SCSI drives are supposed to replace bad sectors by other,
reserved sectors as soon as the drive encounters an error.

Are You shure, that the file is OK? With 1ST Wordplus documents in papyrus
I had never any problems.

> I have Papyrus 7.5, perhaps I need a newer version?

Try the latest demo version (10.2X) from the papyrus homepage
(<http://www.papyrus.de/files/PapX_TOS_Demo.zip>). AFAIK You can save
documents with this demo version.

Gruï¿½,
Karsten

On my Milan it behaves like on a ST/Falcon with NVDI, i.e. it use a too big fontsize and totally mess up the display. A pity, because 1ST Word Plus is one of my all-time favourites on the Atari. I'd really like to get my hands on the sources and modernize it a bit.

> IIRC there's also some converter program, 1WP2RTF or the like.

Thanks, I've tried it now and it seems to work. It doesn't do a perfect convertion, but good enough :-)

Yes, the files I tested turned out fine when viewed in 1ST View. However,
I got a bus-error in Papyrus' textconv.prg, it could be that this binary
is damaged.

I have version 10 and sometimes it crashes when trying to load or import files.
I have a Hades060. What usually works is turing off the cache. For some reason
Papyrus works a lot better. After the file loads in, I just turn the cache
back on.

5257. [PUB]: New at the Belgian ftp-server

Newsgroup: comp.sys.atari.st
Date: 2005-12-13 19:23:45 UTC
From: Martin Byttebier <geek@atarians.com>
Message-ID: <439f1fc1_1@x-privat.org>
Source record: 9981

```
New at the Belgian ftp-site chapelie.rma.ac.be
----------------------------------------------------------------

**********************************************************
* If a package should be corrupt, please contact *
* *
* tos4ever AT telenet DOT be *
* or *
* saka AT village DOT uunet DOT be *
* *
* so they can delete it and put a good version here *
* *
* Only with your cooperation this site can become good *
**********************************************************

Recently the ftp-server underwent some changes. For the moment it
seems impossible for anonymous users to make uploads to the incoming
dir. Karl Samyn AKA saka negotiates with the new net adminstrator to
change this. I hope it will soon be possible to make uploads to the
incoming dir.

In the mean while you can always send the uploads directly to me.

**emulators**
ftp://chapelie.rma.ac.be/atari/emulators/tools/wlnk116.zip
(108.117 bytes) Win_Lnk served originally only to use the Windows
links under MagicPC as real symbolic links. More and more other
MagicPC extensions are also inserted.

**internet**
ftp://chapelie.rma.ac.be/atari/internet/mymail-185.zip
(1.333.795 bytes) Nice and powerful GEM based e-mail client for
STik/STing/Gluestik/MagicNet

ftp://chapelie.rma.ac.be/atari/internet/cat/cat544.zip
(1.394.407 bytes) Cat is a mailer/usenet and a MausNet reader.
Cat is the main program. It's used to read and write mail/news

ftp://chapelie.rma.ac.be/atari/internet/cat/cput544.zip
(242.136 bytes) Catputz: the cleaner for cat. Cat itself can only add messages
to the database, but not delete any. So this is the job for catputz.

ftp://chapelie.rma.ac.be/atari/internet/cat/i2c210.zip
(181.618 bytes) To exchange your Messages not by Maus but by Internet
(Pop3, SMTP and NNTP) you need In2Cat instead of the terminal program
```

utilities
ftp://chapelie.rma.ac.be/atari/utilities/desktops/tera370b.zip
(292.361 bytes) Tera Desktop is a replacement for the builtin TOS desktop
for 16-bit and 32-bit Atari computers.

ftp://chapelie.rma.ac.be/atari/utilities/egale04d.zip
(291.323 bytes) Egale 4.1 (german version): The tool for easy file comparisons,
alteration and analysis. Contains a patch (Dir_Lwr) which makes it
possible to convert the returned string of Dreaddir and Dxreaddir to lower case.

ftp://chapelie.rma.ac.be/atari/utilities/egale04e.zip
(295.788 bytes) Egale 4.1 (English version): The tool for easy file comparisons,
alteration and analysis. Contains a patch (Dir_Lwr) which makes it
possible to convert the returned string of Dreaddir and Dxreaddir to lower case.

ftp://chapelie.rma.ac.be/atari/utilities/deskconf.zip
(20.334 bytes) Desktop Configurator is a small tool which allows you to select
a particular DESKTOP.INF during boot time so you can boot into different desktops
for work or games.

Have fun,
Martin

5262. [ANN] Beta testers wanted!

Newsgroup: comp.sys.atari.st
Date: 2005-12-16 01:08:43 UTC
From: Roger Burrows <sergeantvimes@yahoo.ca>
Message-ID: <q144q1tq8n9ccjqcieeeva6gfa19a9b7vi@4ax.com>
Source record: 9987

We're ready to start beta testing the next version of our CD writing
package, which will support DVD recorders as well. Apart from DVD
support, the main new features are:
. "burnproof" recording
. support for session-at-once audio CD recording
. backup of non-TOS partitions

Beta tester requirements:
. DVD recorder (if possible)
. a copy of ExtenDOS v4
. experience with CD Writer Suite v3
. good command of English or French
. sufficient time :-) (expect to take 10-20 hours)
Previous beta testing experience would be a help.

If you would like to help out, please email us at:
beta@anodynesoftware.com
and tell us what hardware & software you have.

Thanks,
Roger & Claude
Anodyne Software

Yeah I wonder if people would forgive Hitler if he said he was sorry.

Different situation of course, but this guy totally bashed Aranym
developers and made some way over the top comments. Once that happens
he's finished with me. People should learn to control themselves.
Perhaps if I was trying to sell something to the community I would
use a bit more tact, but I'd like to think that my response did have
tact besides the occasional curse word. I re-read my response
and I still believe that it was fully warranted based on the comments this
guy made (which of course nobody can see now).

Next time maybe he won't act so strongly. And maybe next time I won't
REact so strongly. I protect people that do a lot for me and the ARAnyM
crew has done a WHOLE LOT for me.

Thanks,
Mark

Hi!

As for me usenet and other mailing lists I watch made me intentionally
try very hard to overlook any kind of offense. Stick to the facts you
can help with no matter what the guy was touught inquiry looks like at
home. Otherwise you would be off topic the same way as the 'wrong' guy.

STanda

PS: I must say that Francios did the best thing he could at that time.

Hello. I want to get rid of My Atari stuff that I've held on to for far
too long. Frankly I'd rather give it away to someone who might use it.
Therefore, everything is free, buyer pays actual shipping.

hogarthster @ gmail . com

Hardware
Atari Mega2 ST
TOS 1.4
Upgraded to 2 Mb (installed by TOAD)
Replaced the internal drive with a Master 3S, Didn't quite fit so I have
duct tape on front holding case together

SC1224 color monitor

Monochrome monitor, screen blinks (S/N: QT109760)

Quantum Maverick 540S Hard Drive in External case w/power supply
ADSCSI board
ICD drivers

2 joysticks
optical mouse w/pad

Modem cable

ST Replay Sound digitizer

Modems: AT&T Dataport 14.4/FAX, Supra 2400

Software

Utility
ICD Utilities
Cleanup ST
Diamond Back 3
Geneava
Warp 9
Multidesk
Speedogdos 5
Gplus+
Neodesk 3
Degas Elite
Diamond Edge
Maxifile

Yeah.. *sigh* everyone seems to think I was wrong. Oh well ;)

I guess an apology goes a long way in the Atari community. That's
probably a good thing.

Thanks,
Mark

The ATARI ST was just a cheap would-be PC with an 68000 CPU instead of an Intel CPU and a very weak OS and GUI.

The AMIGA always was a REAL computer.Powerful, great architecture, superb custom chips and a superior OS and GUI.

So better throw away your ST fast, because STs are crap and should be dumped in the bin as fast as possible !!!

On my Falcon with NVDI and MagiC, 1WP works fine. I still use it
quite regularly for letters and articles that don't need fancy
fonts.

Incidentally, if IdeaList runs on your Milan, you can use that to
print out 1WP documents with all the attributes (but it disregards
ruler changes).

Hi All

Just wondering what is the market value of the following Falcons:

1) MkX cased Falcon CT2b with 20Gb HD

2) SpaceCase cased Falcon CT60 with 40Gb HD

Both with Maximum ST RAM and reasonable FAST RAM.

Thanks

Neil Chester

From what I've seen, bog standard Falcons have been going for typically
$300-400 on Ebay. Sometimes higher.

Expanded/updated ones are worth more, of course.

So... What?

Atari is still on the Market and for sure is bigger company than Commodore :->

Lets bomb atari for new hardware they got Millions of Dollars :)))

5291. Has anyone in the UK got a 4MB+ Atari Mega STE for sale?

Newsgroup: comp.sys.atari.st
Date: 2005-12-21 22:22:17 UTC

Hi there,

My first computer was an Atari 520STfm and I totally fell in love with the thing. My friends that had Amiga's laughed at my tinny sounds but I couldn't have been happier :-)

I mostly collect Atari coin op equipment now but I still have my ST and I now want a Mega STE and then possibly a TT and Falcon.

So, anyone got a 4Mb+ Mega STE for sale? The more bells and whistles the better!

Many thanks,

Oliver

Not like that;-). It looks like a homebrew controller. Most plug into
the assci port in the rear of the machine. Basically a converter.

Merry Christmas and happy new year for all the Atarians !

Here a screenshoot:

http://the.zorro.free.fr/beta7.jpg

And the news:

News:

- PDF:
* Huge quality improvement in the PDF font rendering (Atari specific).
* Zoom function added.
* Code upgraded to xpdf 3.01pl1(2005-dec-01).
- Complete EXIF 2.21 support for JPEG image(now, you can see various
usefull informations like when the picture was taken, if the flash of
your camera was fired or not, the model of your cam, etc...).
- Now, zView can extract the thumbnails embedded inside JPEG images
created with a digital photo-cam.
That means than the thumbnail creation is 20 times faster if the JPEG
was created with a camera.
- News options added:
* Skip drive(it's faster to skip the check of the CD-ROM drive for
example).
* Smooth Thumbnail: now, you can smooth the thumbnails with various method.
That is very slow and only available on true color or near true color
display but the result are perfect(specialy with the lanczos computation).
* PDF font antialiasing ON/OFF.
* Fit the PDF to the window.
- Utilisation of an embedded font to have the same look on any computers.
- Animated interlaced Gif and animated Gif with transparency now supported.
- More zoom levels for the pictures(25, 50, 100, 150 and 200%,
previoulsy: 50, 100, and 200%).
- Some function's shortcuts added to the toolbars.

Bugs fixes:

- Many fixes in the PDF code(PDF rotated, problems with some fonts, etc..).
- Missing horizontal SLIDER computation in the PDF and image window.
- Little memory leak corrected in the multi-timer function.
- A memory block was not freed in the file_rename function.
- Some redraw fixed (PDF bookmark, etc...).
- Others littles bugs fixed.

Ciao,
Zorro

Hi Sam!

Thatďż˝s the Tramiel Brothers (and more, Shiraz Shivji from C= etc..)
contribution to ATARI.

They called ST for SixteenThirtytwo (mighty MC68000 32/16bit)
And the TT, ThirtytwoThirtytwo. (MC68020/030 32/and 32bit Memory)

www.atari.org

The ST can make many things and is IMHO the best MIDI Computer till
now. Often compared to the Commodore128 ;-).

Best Regards,

Daniel Mandic

Two people not grown up and still stuck in the 1980s mind set of "my
computer is better than yours". Unfortunately all is now history, and
these jibes totally irrelevant.

This is usually down to a Troll seeking to be fed.

5307. atari st rf and monitor question

Newsgroup: comp.sys.atari.st
Date: 2005-12-23 07:28:20 UTC
From: gnorik@gmail.com
Message-ID: <1135322900.848029.73960@g43g2000cwa.googlegroups.com>
Source record: 10034

Hello :)

I have Atari 1040 Ste :)
I have read in the net, that any Atari ST have RF antenna cable with which one can connect ST to any tv :)
It seems that I can't find such interface on my Atari ST, is it possible?

Or may be RF antenna cable should be connected to the same place, where Atari monitor?

Where is RF modulator located Inside Atari case or it is mounted to the cable?

I am asking because I have no RF antenna cable for Atari, I bought it one year ago with only b/w monitor.

And another question is about monitor. I can see TOS screen not fullscreen, but very small, rather big part of the screen takes border, and TOS screen is only 1/3 of my monitor screen.
I can't find any switcher to tune monitor.
On the back side there are only three wheels for sound, brightness and contrast, and some switcher above them. If I turn the switcher up, I can see nothing if I turn it down, I see Atari TOS screen :)

Thank you very much for help.

5308. Atari ST floppy question

Newsgroup: comp.sys.atari.st

Hello, when I am turning Atari on floppy drive is making some noise
during a minute, and only after that TOS starts.
Is it proper for Atari St?
Floppy drive is empty during start, but Atari makes some noise with
it...

Thanks

> possible?
>

Its the single "phono" socket on the back. (assuming its an STE. or STFM,
plain STF does not have modulator.) If its an STE there should be three
PHONO sockets on the back. Two are the stereo sound out and the third is the
TV out. However its really only good for games.

> Or may be RF antenna cable should be connected to the same place, where
> Atari monitor?
>

No, but you can get composite out.

> Where is RF modulator located Inside Atari case or it is mounted to the
> cable?
>

See above. Its inside the case on an STE. Single phono on back.

> I am asking because I have no RF antenna cable for Atari, I bought it
> one year ago with only b/w monitor.
>

In the UK you need a Phone to "Belling Lee". Not sure wjat TV's in other
countries have for arial leads.

> And another question is about monitor. I can see TOS screen not
> fullscreen, but very small, rather big part of the screen takes border,

The borders are big, but usually 2/3 of screen size.

There aren't any. BTW its the GEM desktop that you should see, not the TOS screen. Try setting the thing to "Medium Resolution". Its some where on the last menu.

Hi,

It seems that there is a problem with MagiC, the system return:

Datei ist nicht ausfï¿½hrbar! (File is not executable!)
Fehler: -#66 (Error: -#66)

I will try to correct this problem as soon as possible.

Ciao,
Zorro

TOS checkes for bootdrives and such for about 45seconds on bootup, after that time it gives up and you are then at the GEM desktop. If you put a blank disk in the drive then the boot sector of the floppy is read and TOS has "something" actually read, if there is nothing on the floppy then it boots right to GEM.

Hi Clockmeister!

I think you confuse that. Atari ST/TT have the better OS. The MAC
copied it only.
Mac is now with G5 and thirteen ventilators, behaving clunky as an
overloaded PC and that all to play some MP3ďż˝s :-)

Thanks, Iďż˝ll stay with TOS for that 'similar' you mentioned.

Best Regards,

Daniel Mandic

Anyone have Steffen's (the author of GEMAR and CBHD) current address? The latest one I had was: steffen.engel@t-online.de but I got no reply from a mail to him there. The others I have are Maus addresses but I don't think these are valid any longer.

Regards, /Peter/

5320. Any way to make PC as good as an ST for web browsing?

Newsgroup: comp.sys.atari.st
Date: 2005-12-23 20:27:17 UTC
From: STcomp@cwo.com
Message-ID: <1135369637.560503.109790@f14g2000cwb.googlegroups.com>
Source record: 10047

I have had it for the last 10 years with PC web browsing! I started on an ST in 1996, and since 1997 when I went PC it all went downhill in many ways

In the Atari ST days, the browser would default to caching web pages in ram, resulting in the ability to flip as quickly through as many of the last pages you had visited as you liked! (you could click the browser back arrow 10 times in a row, and it would actually flip back 10 web pages just as fast as you could click!) It would actually use the 4 megs of extra memory I had so that recently visited pages could simply pop up on the screen instantly from RAM.

In contrast, the microsoft crap seems to default to reloading (usually at an even slower rate than the first time the page was visited!) the whole web page even though I had just been there 15 seconds before. Never mind that there is 300 megabytes of unused ram just sitting there. Any way to make my microsoft crap PC act as intelligently as my ST did back in 1996? Thanks. -SaTcom2

5322. [ANN] DGEM 0.20

Newsgroup: comp.sys.atari.st
Date: 2005-12-23 21:49:42 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <43ac70f5$0$11347$7a628cd7@news.club-internet.fr>
Source record: 9899

Bonsoir :)

New version of my Dungeon Master clone, download on my
website or directly in the folder http://rajah.atari.org/files/
-> dgem020.zip (1.7 MB, dezipped: 7 MB)

New in this 0.20 Xmas2K5 version
- all the monsters
- hand to hand fighting

Carefull, since this version, the program needs more memory.
8 Mo under 16 colors mode, 14 Mo under 256 colors mode.
Under 16 colors mode, some monsters appear with false colors

Minimum requirements :
STeem/Nostalgia/Hatari: TOS 2.06, VDI extended mode, 14 Mo
Falcon/TT/clones: TOS 4.04 (MagiC advised), 256 colors, 14 Mo

In this dungeon, the monsters have 1 health point.
A zoo is present at level -7, via the teleporter.
If you want to modify this or create a new dungeon, use
the Deditor. The current password for this example dungeon
is 'eil3'.

Coming next : throwing objects, casting spells, atmospheric effects,
throwing thing generators on wall... There will be not 0.22 version,
but 1.0.

Hope you'll enjoy. Merry Xmas, and Stay Atari :)

Source record: 9906

Merry Christmas to you all,

There's two updates related to ARAnyM :)

<http://eureka.atari.org/MacAranym.zip> is a binary snapshot
0.9.2pre1 of ARAnyM for MacOSX. It was built with Xcode 1.5
under OSX.3.9. This package contains a boot disk image that
is suitable for latest improvements of ARAnyM, similar to
AFROS (ATARI Free OS). Ready to use.

<http://eureka.atari.org/xa-my-aes.zip> is a boot disk image
that is suitable for ARAnyM 0.9.0 (all host platforms). It may
be better to use a stable version (0.9.0) specially for devel
purposes. This disk image was updated with a December 23th
snapshot of freeMiNT, and follows all other developments
such as zView beta 7 etc.

It's up to you !

See you soon for updated news of the ATARI front ...

Source record: 9909

Thank you very much for answer.

But I really have Atari 1040 STe, its with AZERTY keyboard and french
GEM :)

But on the back there are only...
left to write:
modem port,
printer port,
hard disk port,
floppy disk interface,
then monitor interface, and then two audio jacks with letters "R" and
"L", and there are power switcher above.

Then there are power socket and reset button.
Also I have two midi sockets on the left side of Atari, one unknown
interface, two joystick ports, b and a... I also have another two
joystick ports , but can' find "phono" :)
I can take a picture and post it... Is it possible that french Atari
STe have no rf port?

>> Or may be RF antenna cable should be connected to the same place, where
>> Atari monitor?
>No, but you can get composite out.

Wow!
I haven't read about it, I have read in newsgroups how to connnect
monitor socket to scart, but not to composite.
Please, give me a link if possible.

Anyway, I'll connect Atari to my LCD screen thourgh tv tuner or video
capture board, which both have composite in

Thanks

Hello all,

A Christmas release of GEM Instant Messenger has arrived. GEM Instant Messenger is an AOL instant messenger compatible IM client for Atari systems running MiNT. This version has fixes of iconification, font selection issues fixed, it's built with Windom 2.0, buddylist size/position is saved in the configuration file, debug text has been isolated and removed, bug causing buddylist to redraw over everything fixed, and restructuring and beautification of all dialogs.

Now I'll be working on the Sparemint Update Manager to get a usable release now that I finally got my new server up and running. It shouldn't be long at all. Also the site is almost ready to go again :)

Once that is done, I plan to rebuild gim mostly from scratch using the current version of libfaim. In this version, now that I have much more GEM experience, I will make sure everything is *very* pluggable so that protocol plugins can be used, and the new version of libfaim has many nifty features like server side buddylists and more!

Have a merry XMAS and happy to holidays to people who swing the other ways :)

Thanks,
Mark

Umm, why don't you ever quote a price when you mention this system?

I mean, I've seen you say you'd let it go for "serious" money several
times but never an actual figure.

Just curious.

That is one thing I have always liked about the ST. You do not have to worry about it or remember to hold down certain buttons to get the disk to boot. I wish my Hades was like that.

>
>Thank you very much for help.

The monitor has this border normally. YOu can make it smaller and increase
your viewing size by going in and doing some electrical adjustments. There is
an article about this on the Net. I would just buy the variou SVGA adapters
that exist for the ST. This will allow you to hook up a PC-type VGA monitor,
but will only give you mono. The screen size is MUCH larger. That is what I
did and it works fine.

Thanks a heap for this. Plays great on the Hades, but I get no sound as yet. I do not have the appropiate sounds card yet. It there anyway the sound can be generated through the ST-Soundchip as in the ST version. I have that chip in my Hades which, for now, is the only way I get sound?

>Carefull, since this version, the program needs more memory.

>

Its possible as French TV has some "odd" standards. Indeed when I looked I
found this:-

http://mpc.fab.free.fr/atari/atari16-32/pstf.htm

Which shows a French STE with no RF output port, so perhaps the french STE
did not have this port.

> >> Or may be RF antenna cable should be connected to the same place, where

I wonder if the french STE is also lacking composite. Normally only machines
with Modulators had composite.
In any case I wouldn't use it except for the odd game, its really poor
quality. I found pin-outs at :-

http://pinouts.ru/data/AtariStMonitor_pinout.shtml

English ones are like this:-

http://www.myoldcomputers.com/museum/comp/1040st.htm

which is an STE as it has the extra joystick ports and the stereo phonos...
You can see the TV Out between the Floppy and Monitor ports.

Hi Ronald

Your right, the PAK cost £850, the FRAK and memory £400, the MV300 was £350 and the FPU another £150, SCSI board was £75, Hard Drive was £175, well expensive aint it?? The software it contains is worth near to £500 alone!

5356. ModPlayers & ARAnyM

Newsgroup: comp.sys.atari.st
Date: 2005-12-26 09:19:50 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <43afb5b6$0$18323$8fcfb975@news.wanadoo.fr>
Source record: 9932

Hi devs,

I just downloaded two ModPlayers :

GemPLAY 0.97 [25.12.05 23:58]
Link: gemplay097.lzh Yescrew

mxPlay 1.00 - best module player for your Atari Falcon [24.12.05 23:58]
Link: mxplay.sourceforge.net mxplay.atari.sk mxplay.lzh

from http://atari.sk/

and I tested these with ARAnyM. The problem is that these
players are performing a detection of the Falcon hardware.

But do you know that GSXB is implemented, and that the
DMA sound system and DMA system calls are present, though
there's no Falcon hardware.

Instead of detecting the Falcon hardware, you should better
detect GSXB, and use DMA calls as usual. That's so simple !

GSXB is at : http://assemsoft.atari.org/gsxb/

I'm telling that about ARAnyM, but it is the same problem
on my Hades 60.

You should think about it :)

Best regards,

> on my Hades 60.
>
> You should think about it :)

I did, but unless u have DSP working in Hades (MOD, ACE, GT2, AoN all use DSP replayers in GemPLAY, to minimise CPU usage) GSXB will not help u much. Reason for DSP is clear: no way to replay ACE, MP2/3, GT2, AON on less as 060 CPU and even on 060 u may have probs, not to mention that leftover CPU power will be weak. For example: MP3 takes let say 80% CPU power on 060, so its not exactly usable as background player... Falcamp use maybe 5%, Aniplayer with DSP 10% or so...

Personaly i prefer using fast DSP replayers, so owners of "plain", "slow" Falcons can enjoy music and still have most of the CPU free for other tasks. Falcon 030 owners must NOT be bannes, just we have faster machines, esp since 030 Falcons are capable to replay all those formats... I also made separate players in ACC versions, so TOS users may enjoy music while doing other stuff.

Janez

> it emulate that one, so how we should call it?

Well ... "virtualize" has a bad consonance for a machine. Would you
prefer that it "runs it independently from OS and Hardware" ? That is
a strong assumption !

> Problem is: Aranym dudes and
> fans goes berserk if we call Aranym emulator or when we say its not an
> Atari.

ARAnyM is a unique experience. Because the bytecode of the virtual
machine is inherited from 68k processors family ... You should feel
comfortable with it ;)

> Noone say Aranym is crap, we know what it is and what it can do, how
> fast is, etc. We also know that Apex Media snapshoots are fake, since if
> program does start, but then crap on 90% of options and things it SHOULD do
> is misleading.

It's not fake, because Petr has a 040 version of Apex directly from
Douglas Little :) That's what I understood ;)

> But okay, we cant deny it starts! Still Aranym comunity
> will not stop until we will say that TT ot Falcon are crap and not Ataris
> since Aranym IS real Atari..

Well ... Why do you want to oppose the communities of developers ?
We're all going the same direction indeed !

> Aranym use native host hardware, instructions are translated (eg emulated,
> simulated, virtualised all u want just not EXECUTED), hardware is either
> host hardware OR simulated, translated, emulated, virtualised, whatewer
> (VIDEL for example) and also depends heavily on underlying OS, so "ATARI"
> OS calls are again translated, virtualised, simulated, emulated on oh so
> many layers..

And it compiles bytecode "on the fly" with a 'Just In Time' compiler.
That's why it is not called an "Emulator". No other systems do it
the same way.

> Now where "It is an Atari machine" comes from? What can for
> example GEMDOS $39 (makedir) do on Aranym without Windows, MacOS or Linux?
> Absolutley nothing.

It's an ATARI machine that runs independently from OS (also Solaris,
BSD etc.) and hardware (x86, PPC, SPARC etc.).

You should think about it :)

Best regards,

Very possible, as French TVs use SECAM, not PAL, and perhaps Atari
wouldn't find it worth while to produce a modulator for this
restricted market...

5364. Floppy disk games

Newsgroup: comp.sys.atari.st
Date: 2005-12-27 04:10:01 UTC
From: Rory McMahon <rorymcmahonNOSPAM@yahoo.com>
Message-ID: <a3f1r1tpcl7v4oa5dvf4e55911lrpcrjv8@4ax.com>
Source record: 9941

Hi all,

I have amassed an unwieldly amount of 3.5" 720k non-original game,menu
and game demo disks. I have tested quite a few and most work fairly
well. Some need a 50/60hz program, but most boot to the game start.

My dilemma, how can I get rid of these, and make a few bucks, make a
few people happy. Should I format them and sell them as blanks or
leave em as is? I would sell them in lots of 50 or 100, couple extra
for possible bad disks? $4 + cost of shipping? Dunno.

Or should I just put them in the dumpster?
I couldnt possibly make a list of all the games. There are just too
many and I'm really short on time anyways. Any ideas?

Thanks
Rory

Rory,

I also have a lot of game demo disks and all I can say is that I would never get rid of them. Just list what is on them and offer them for sale. Most of the demos offer a big part of the game and should spark everyone's interest.

Aniplayer alternatively make usage of FPU, that is justified.

> Personaly i prefer using fast DSP replayers, so owners of "plain", "slow"

> tasks.

It is not a problem of CPU power under ARAnyM :)

> Falcon 030 owners must NOT be bannes, just we have faster machines,

How many working Hades 60 is there around the world ? I wouldn't
be surprised if it could be counted with fingers of two hands ;)

> I also
> made separate players in ACC versions, so TOS users may enjoy music while
> doing other stuff.

You're doing a brilliant work :) The problem is that with my machines
I can't benefit from it. DBEplay works on my Hades 60, and Tetrax
under ARAnyM. But I've no idea of the quality of your player since
it detects hardware that don't exist on my machines.

I hope it'll help.

Best regards,

5368. CT60 - Problems in Falcon mode

Newsgroup: comp.sys.atari.st
Date: 2005-12-27 12:59:20 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <dordl6$2aj$1@news7.svr.pol.co.uk>
Source record: 9943

Hi All

Thought I'd use the Xmas holidays to get the CT60 Falcon working, after changing the HD to a 3.5 Maxtor 40Gb one night very successfully I thought that the flaky days of programs not running/disappearing were over! I hope they are not back again....

I am currently setting up the computer in Falcon mode (eg CT60 mode switched Off). I backed up my files from my CT2b's boot drive so that I could going faster than installing each application. This also means I have an adjusted MAGIC.RAM file for CT60 mode. TOS mode seems to be working correctly so I tried a Magic boot, second time it got through to the jinnee desktop OK. I tried to adjust the Video mode with VIDEOMOD.ACC (as supplied with Centscreen 3, this displayed the usual settings box but then as soon as I selected anything the box disappeared and also disappeared from the ACC menu at the top of the screen! Loading it in by double clicking on the ACC file didn't resolve the fact that it had stopped working.

I remember I had this problem before with the old 2.5" drive installed except that Magic packed up and refused to work after some days. Even re-installing failed to get it working.

Is it a hardware or a software problem?

The micro ATX PSU is sat right above the CT60 board, I wondered if there was interferrence or heat problems.

Any suggestions would be helpful.

Neil :-(

Incidentally,

It might be worth mentioning that GIM implicitly supports ICQ but in a
limited fashion. If you sign on to an ICQ account with GIM you can send
and receive messages from both AIM and ICQ users. If you sign onto GIM
with an AIM account, you cannot send/receive messages from ICQ users, but
only AIM users. So users of aICQ can feel free to give GIM a try as well.
The buddy list is ugly though, fair warning ;)

Thanks,
Mark

For encoding, not playing. The old 56001 is faster than the 060 FPU.

Regards,

Didier.

> For encoding, not playing. The old 56001 is faster than the 060 FPU.

Yeps. Encoding is different matter and raw cpu power does count a lot :) I also like the fact, that if DSP is busy playing. CPU is free for other tasks. MP2 for example, with great sound quality, takes less as 1% CPU on 030 Falcon. Ideal for multitasking.. And sound is not inferior to MP3, quite the opposite... MP3 is harder on CPU, since it can not be played in DSP only, but still it just pass on plain Falcon... ACE eats a lot of CPU even with DSP, so i doubt 060 would even be capable of playing all ACE tunes...

I would like to stress that using those player is NOT because we would hate Hades, but because those players can be used on plain Falcons, or CT2 machines... That is the only reason i used them. And if some Hades owner would write ACE or GT2, XM player that use 060 and Hades systems, believe me, i would be happy for Hades owners, i would not attack author where is Falcon/ST whatever version...

SO its a cheap "would be" PC because it had a 68000 instead of an Intel
CPU? Well friend, then throw that Amiga away as well because it also had a
68000 CPU! (and one that ran slower than the ST).

> The AMIGA always was a REAL computer.Powerful, great architecture,
> superb custom chips and a superior OS and GUI.

The Amiga was a pretty cool machine. I might have actually bought one when
they came out, if I wouldn't have had to sold the farm, the house, the
car, the wife and kids, and the dog just to meet that pricetag! I was able
to buy my first ST, which did most of what the Amiga could (and some
things it could not), for about a 1/3 or 1/4 of the price of an Amiga.

> So better throw away your ST fast, because STs are crap and should be
> dumped in the bin as fast as possible !!!

There seems to be a small group of people who want to throw STs in the
garbage bin...with a much larger group standing in line to retrive them.

:-)

Why, exactly, would a company that specializes in vintage software need
to run a clearance sale? Are you trying to clear the shelves, waiting for
the new Atari models to arrive for '06? Are you trying to cash in on those
Jaguar games, before these newfangled Playstations get popular?

> it detects hardware that don't exist on my machines.

U must know that in GemPLAY i didn't develop new replay routes. GemPLAY code is only GEM shell, and wrappers arround existing replay routes, so AVSERVER etc can be used. I did choose fast routes, having majority in mind, Falcon 030 owners. Since many of replayers date from early days, they are Falcon only, since at that time that was most capable machine (AoN, GT2) so they use DSP. New ones as ACE, uses a lot of CPU and DSP, so i doubt it would play on 060 alone.

>It is not a problem of CPU power under ARAnyM :)

True. But it is problrm on Falcons, and i personaly care about Atari's more as about Aranym. People using Aranym can compile MikMod for example, it should work, but it is hopelessly slow on 030/060. I'we heard so much about Aranym superiority (not from you, i admit!) so im suprised Falcon 030 releases are commented: "Why there is no Aranym version". Maybe Aranym developers should consider DSP emulation, as we all know what "Aranym" acronime means... But to repeat, DSP is not used to filter Aranym users out, but to make stuff decent on Falcons (which are the in majority) with lack of CPU power..

> I hope it'll help.

Well it won't help much with this particular application, im affraid. I don't intend to make apps which deliberately don't work on Aranym or compatibles, just optimising is targeted toward Falcon or even ST...

Regards, Janez

He's right. GEM was/is awful, after all why did things like NeoDesk(and others)sell so well if GEM was so great? Of course, the M$(IIRC) developed Amiga OS was no winner either... The Atari's were still nice/useful machines though, and could emulate everything else usefully, along with a decent pricetag plus 3rd pty. software support.

My list of '80's OS(small system) ratings:
1. UNIX & X (pricey, but what the hell... and only stable one...)
2. System 5/6 (only missing perfection by lack of preemptive multitasking)
3. GS/OS (hobbled by Apple purposefully)
4. GEM / Amiga OS(too fugly)
5. Windows
6. OS/9
7. MSDOS
8. other 8bit proprietary OSes(DOS, ProDOS, etc. and things like CP/M

(Looking at the list it's kind of funny how things went from those damn stable little 8 bit proprietary OSes to the graphical card houses, excepting UNIX... bombs(Atari & Mac), guru meditations(amiga), BSOS(windows (or was it then? don't remember any more)), just dying(MSDOS))

By your own arguement the same can be applied to below - if they were so
great, why were there popular replacements? Example, 4DOS for MS/DOS. If
you're listing this as your opinion fine.

I for one would never have uses X in the 80's. Really, what popular
software ran under it? Games? Just curious.

Unix and X didn't have any problems? Hmmm.... :-)

PS BTW, I don't think MS had anything to do with the Amiga (thank God!)-
in fact, most of the team was ex Atarians, IIRC.

5388. CT60/CT63 Software compatibility

Newsgroup: comp.sys.atari.st
Date: 2005-12-30 19:37:53 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <RZftf.78218$k76.35722@bignews6.bellsouth.net>
Source record: 9865

Greetings,

I have been pondering over to get a CT63 or not.

I have 2 CT2B Falcons that work great and have no hardware/software
compatibility problems with the stuff I use.

I also have several Falcons that are fairly stock including a SONO VISTA
that I just acquired.

The speed of the CT2B is fast enough for what I do. And is very
Compatible.

Although Rendering Images and 3D stuff would go faster with a
CT63 if the software is compatible.

My questions goes to the owners of a working CT60/CT63.

I'd like to know how much software is compatible.

Generally, I use most of the major Graphics/Animation software,
D2D Recording software, DTP, and Net Software, SCAN X for
Color Flatbed Scanners and the ColorBurst HandScanner.
Cubase Audio Falcon, Emagics LOGIC Atari with UNITOR II and
LOG 3.

Apex Media, True Image/Paint, Rainbow Multimedia 2, all the Lexior
Software,
such as Chronos 3D, Phoenix 2.0, and etc. Also VideoMaster Falcon
cartridge and
software. Positive Image, are some that I use most and need to know if
these work.
Also VIDI ST 12 and software.

Especially Apex Media, and VideoMaster Falcon software and Cartridge.
CUBASE Audio Falcon v.2.06 and EMAGICS Logic Atari with the cartridges
for SMPTE and extra MIDI support.

I am also interested to know if the extra memory can be used to record
Music and Sound to, with programs such as SAM, Cubase and others.

I'd like to hear from owners of a CT60/63 and the software that they use
without
problems in accelerated mode.

Also any software that doesn't work or has some problems running in
accelerated
mode.

This will help me decide if a CT63 is right for me.

Thanks,
phantomm@bellsouth.net

5389. Falcon and Recording to SCSI Tape Drives

Newsgroup: comp.sys.atari.st
Date: 2005-12-30 19:42:35 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <p2gtf.78235$k76.55827@bignews6.bellsouth.net>
Source record: 9866

Greetings,

Got a question about using SCSI Tape Drives on a fairly Stock
Falcon to do Direct to Tape recording.

Using HD Driver, will this work with most SCSI Tape Drives?

I have a HP Tape Drive, that has been used for storage on an
Atari.

Would it be reliable to record Music to it?

Thoughts?

It should work, but you need a SCSI tape (DAT?) driver. HDDRIVER
provides the SCSI driver, but just like with CD-ROM drives you need a
device-specific driver to make use of this interface.

I was told that it was used on a Atari system before.

Anyway, Does ExtenDos support SCSI Tape Drives?

I use it for CDROM/CDR drives. Never checked on Tape support.

I know that Syquest Drives and the like suppose to work.
I Remember someone posting about using Tape Drives on
the Falcon before.

If anyone is using a SCSI Tape Drive on a Falcon or other
Atari, Post what software you are using and the type of drive.

I think it will work. But I am not sure if the writing speed to
Tape would be Fast enough to do Direct to Tape Recording.

It would help if someone knows how fast a SCSI Device must be
to keep up with Direct to SCSI Device Recording.

Copying files over to tape wouldn't be a problem.

However, when Recording a Live Song or Track I'm not sure
if a Tape System would be as fast as a Hard Drive when
writing. A Buffer may help if it doesn't cause any loss of
sound quality.

I know the Falcons SCSI system isn't a speed Demon compared
to the latest Computers.

What I have is a HP SCSI Tape Drive. It's a 3.5 Drive IIRC.
It uses very small Tapes. Around the size of a small Match Box.

The Tapes are still being made AFAIK and I have alot of them
already. If I can't use it to do Direct to Tape recording, then
I'd at least like to use it to store completed Song Tracks.

Or for software backups and etc.

Info anyone?

phantomm@bellsouth.net

Hi all,

I will gladly sell them to whomever would like them. I was think of selling them as a set of 25 or by the pound(weight). I have tested most of them to see if they boot. About 85 percent boot to the game noted (in pen or pencil marked directly on the disk or some have labels). A lot of them are PAL games that seem to scroll the 1224 or some are 50Hz (seem shifted to the left). Not sure how much in demand those would be. It doesnt matter whether I ship them or somebody picks them up, or I format them or leave them as is. I've assessed that I just have too many 720k floppies for my own use, and would like to see them used for those who need some or all of them!?!. LOL.

I dont want to toss these by any means. Buy some!!! If any game disk I have that you buy wastes 5 minutes of your time, my job is done! ;) Muhahahahahahahahahaha....

Thanks for letting me bend your ear.. Have a happy New Year!
Rory

As far as I know,with a CT 60 the fast Ram won't necessarily help with digital audio recording. Most of the audio programs are set up for ST Ram. I would say the exception is if you set up your fastram as a Ram disk, then I know that Zero X will record to the Ram disk as if it was an actual hard drive.Cubase audio won't do this its very restrictive as to the kind of HD it records to. I.E. Scsi! I don't know if other audio programs would do this. The problem is finding a Ram disk program that will take advantage of the "massive" amounts of memory available with a CT60.
The one program that is amazingly fast and really speeds up disk operations is True Disk which was a freeware program. It has been updated to take advantage of extra memory but that version is unavailable from the author. Too bad as I have 500 megs of memory!
I would venture to say that its probably not worth it to convert the CT2B Falcons to stock and then to CT60. How many Falcons do you have anyway???
I think most of the programs you have would be compatible with CT60 and you would probably notice a big speed increase. You would have to be careful as the bus speed is increased with a CT2b but the same bus increase requires some extra installation work with a CT60. This bus acceleration with a CT60 may cause some problems with Digital audio.
And then there is the screen res. Without the videl acceleration you may not get the same screen res you can get with a CTB2. On the other hand, there are 2 models of video cards in the pipeline. check out Czuba's website for a list of compatible programs.Also the Dead Hackers site has an extensive bulletin board for CT60 users. I know Emagic Logic (midi) works and its very fast. If I had a couple of stock Falcons lying around I would definitely go for a CT63, especially if it includes the clock module and a Rev 6 060, some of the bugs are worked out and the firmware is all up to date.
Thats my 2 cents,
Mark

But not without a device-specific driver. Fact is that for each SCSI device you need a specific driver in order to access it. You cannot access a tape drive with a CD-ROM driver or a hard disk driver, *unless* this device reports itself as a CD-ROM or hard disk device and implements the same SCSI commands as these devices. But SCSI tape devices do not do that because they are SCSI devices of their own, with a special command set. This is why you need special drivers also under Linux, for instance.
GEMAR by Steffen Engel ia a driver for SCSI tapes for the Atari. I think it is shareware, you may find it on some ftp servers.

Note that a tape drive may rewind the tape while recording, which is bad for direct audio recording.

Hi,

My ST/e is packed up and ready to be collected by its
new owner.

I wrote my own backup/restore software to access
a QIC-150 SCSI tape drive. It works quite well, though
it's perhaps a little under-documented. If you have the
capability of compiling the source without asking me *too*
many questions, then you're welcome to the source.

Steve.

5398. AtarICQ 0.166 released

Source record: 9875

AtarICQ 0.166 released

The holidays are coming at an end, and just in time for the new year we
now bring you a new version of AtarICQ! Lots of things have changed,
and even though most of them have been invisible there will also be
more appearant changes for you to explore.

For those of you who have upgraded to a recent version of XaAES, you
will now find that aICQ supports its excellent keyboard navigation
scheme. That is, via TAB and ARROW keys you will be able to navigate
through the GEM dialogs of all programs that handles this properly.

Secondly, we are excited to present the first implementation of support
for the AOL instant messenger protocol in AtarICQ. The support is still
being worked on, but we consider things to already be working well
enough to be highly useable.

Here is a screenshot that gives you an idea what it feels like to mix
ICQ and AIM contacts:
http://www.ataricq.org/ataricq/20051206_AtarICQ-2.png

Add to this a substantial list of bugfixes and other improvements, and
you find yourself with well enough
reasons to upgrade :)

Read more and download the new release on the AtarICQ webpage.

http://www.ataricq.org/

Happy new year!

Regards,

/Joakim

5400. New XaAES development snapshot

Newsgroup: comp.sys.atari.st
Date: 2005-12-31 16:07:52 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1136045271.976155.5890@f14g2000cwb.googlegroups.com>
Source record: 9877

In the final hours of 2005, there is now a new development snapshot of XaAES available!

The most interesting changes this time is the new keyboard navigation scheme, and the improved
support for wdialog functions.

Keyboad navigation has been something we take for granted on other platforms, and the implementation
in XaAES is similiar although not identical. It even allows for navigating the GEM menu bar via the keyboard!
("Open" menubar with CTRL+ALT+SPACE, and use ARROW-keys and RETURN to walk/select). For normal dialogs, you can either
walk according to object order with TAB, or use the ARROW-keys to move focus UP/DOWN/LEFT/RIGHT. SPACE will select the focused object whereas RETURN will select the object that has the default bit set.

The new XaAES binary now has support for the wdialog pdlg_xx(). This seems to make a few picky programs that uses the printing setup in wdialog now finally useable under XaAES!

Last and perhaps least, you will also find that the unofficial XaAES page has had a visual update. Hopefully it will now
be nicer to look at and also easier to maintain due to some basic useage of PHP.

Read more here: http://xaaes.atariforge.net

Happy new year!

Regards,

/Joakim

Thank you ver much.

XaAES is a must be for every one. IMHO, it's a mature OS now.
I haven't uses N_AES since more then a year now and I still haven't
regret that.

5408. [FS-UK] 2 Upgraded Falcons CT2B/CT60

Newsgroup: comp.sys.atari.st
Date: 2006-01-01 16:06:27 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <dp8ugk$g48$1@news8.svr.pol.co.uk>
Source record: 9885

Hi All

After many years of being an Atarian I shall have to sell my entire Atari collection due to lack of space! :-(

An advert may appear on eBay if I can figure out how to do it and get pics of everything.

Here goes:

Hardware
****
Atari Falcon CT60 housed in a modified 19" rack (Spacecase), this was assembled by Lyndon Amsdon complete with an internal Eiffel PS2 adaptor. I have fitted a CT60 on/off switch and a 3.5" Maxtor 40Gb IDE HD.
14Mb ST RAM, 256Mb FAST RAM (Crucial module).
Sensible Offers in UKP.

Atari Falcon CT2B housed in a C-Lab MkX case, CT2B fitted by Shiuming Lai whilst he was at System Solutions. Complete with an external Eiffel PS2 adaptor. CT2B on/off switch. Fitted with a 20Gb 3.5" Seagate IDE HD.
14Mb ST RAM, 64Mb FAST RAM.
Sensible Offers in UKP.

iiyama Vision Master Pro400 17inch CRT VDU, VGA multisync monitor with excellent display quality. Used with CT2B machine daily at 800x600 in 256 colours.
100UKP ono

Microvitec 1438 14inch Autosync CRT VDU, VGA/RGB monitor if used with a suitable ST/Falcon switchbox. Falcon switch lead can be supplied. Upto 100Hz refresh, but can easily handle ST LOW as well!
50UKP ono

Epson GT9500 A4 scanner SCSI & Parallel interfaces, GT Look software for Atari supplied. 40UKP ono

Epson Stylus Color 600 inkjet printer Parallel/Mac, works a treat with NVDI on Atari. 50UKP ono

External 56K K-flex Modem, used daily with CT2B. 25UKP ono

Adtron Accent SCSI PCMIA external card reader, can read Compact Flash cards with an adaptor, others supported.
150UKP ono

Yamaha SCSI CDRW 16x10x40 housed in external SCSI case. 60UKP ono

Mega STE external keyboard. 60UKP ono

ASP/ Mario Becroft Mouseburster PC serial mouse adaptor with hi-res mouse. 20UKP ono

ASP SCSI Burster lead for adapting a suitable case to be a SCSI cluster, 3 way version. 10UKP

Atari Jagpad. Offers

2 micro switched joysticks, 1 is a Zipstick and other is Cheetah Mach1(?). Offers

Drives - any offers accepted:
36x SCSI CDROM drive.
Syquest 135 SCSI drive bare, 2 carts supplied.
?384Mb HP SCSI HD has a cache.
2.1Gb Maxtor IDE 3.5" HD (was used in CT2B).
730Mb IBM IDE 2.5"HD supplied with Falcon fitments (was used in CT60).

Software
****
Just a list, maybe included with a machine package:

Atari Works, Diamond Back3, Diamond Edge 2.5(updated ver), Kobold 2.5 & 3.5, Pure Pascal, Texel, Emailer, Magic 6.20, CAB 2.8, NVDI, jinnee, CD Writer Suite, Extendos Gold.

Mega Lo Mania (ST/Falc), Running (Falc), Substation (STE/Falc), Obsession (STE/Falc), Desktop Solitaire.

Some shareware registered titles.

Atari Computing issues 1 to 16 inc CD and some subscriber disks. Offers.

Thanks

Neil :-)

5409. Re: Has anyone in the UK got a 4MB+ Atari Mega STE for sale?

5413. Re: CT60/CT63 Software compatibility

Newsgroup: comp.sys.atari.st
Date: 2006-01-01 23:06:09 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <43b8605c$0$12493$626a14ce@news.free.fr>
Source record: 9890

Yes, sure, CT63 includes the CTCM and the 060 Rev.6 at 95 MHz minimum.

But only 9 cards still available (not reserved).
The boards are actually assembled in the factory...

I do not think I will produce a new run after...

Maybe the last chance to get one..

This afternoon a french guys came to see me at my house with a falcon mb to repair and he had alrerady (8 months ago !) reserved one CT63.
He paid me cash for 2 others CT63 because he has 4 falcon at home !

About software, I can say that the CT60/63 is at least equal to or maybe more compatible than CT2, because of some bad design on CT2 (like TT-RAM not at the $01000000 adress (need to use the PMMU and it is not 'transparent' with some programs) and the DSP IRQ that is not connected...)

There is a list of tested sofware and games on my web site !

About TT-RAM (SDRAM), Cubase use it a bit !! In fact You cannot flag Prog RAM in the FILE INFO CPX because it will not run correctly (no crash) because the AUDIO SDMA BUFFER is chained to the CODE of the software---> if you let the cubase audio to load into SDRAM, the buffer is into SDRAM and SDMA chip is not able (like blitter) to reach the SDRAM to rtransfer audio or read audio...the result is that cubase audio run VERY FAST, but you hear nothing on the AUDIO curcuit !
BUT you can flag the other part of TT-RAM : the DATA MEMORY...and Cubase uses it ...and you run really faster on some operations.
Note that this flag configuration was/is the same possible with CT2...

Regards

5417. Autosort problems with Jinnee and MagiC

Newsgroup: comp.sys.atari.st
Date: 2006-01-02 05:03:27 UTC
From: "J.Kock" <kock@kockens.pp.se>
Message-ID: <khchr19caous2pp3d90mipm7k0nk4t5fu5@4ax.com>
Source record: 9894

Hello, i cant get Autosort.prg v4.1 to work with MagiC OS running Jinee as desktop on my TT. It says "Not enough memory" errorcode #-39

Why? I have 13,7Mb RAM free !!
It doesnt even work in singletasking mode.

any suggestions?

5418. There is still a German ATARI group.

CiH posted on www.dhs.nu and asked people to write their 2006 wishlist.

My no. 1 wish was continued Xaaes/FreeMiNT development :-)

I've been using Xaaes as my only AES for the last 6 months, and it
really gives me a reason to continue using this computer. I almost
didn't touch my Atari for 2 years - now I use it on a daily basis
(thanks to Xaaes).

It hardly ever crashes (except when provoked by my bad programming), it
looks pretty, it's fast, it maintains that warm fuzzy Atari feeling but
still looks and feels like a modern environment should do. Above all,
it's still developed and supported, and each new release gives me a
surprised look on my face. I'm so impressed by the whole effort.

If you haven't already tried it, please do. Take some time to set it up
properly.

CHILL. POUR. ADMIRE. (Well, that's Guinness, but anyway..)

Not sure what you mean here ? Did you send other mail to me - if so it would not have reached me. Zetnet Pop3 mail server is down as far as fetching mail is concerned - might get it back tomorrow.

>http://www.geocities.com/wjdegraaf_geo/mc303/cubase/cubasev2atari.zip

I've been told that Cubase 2 is not usable on Falcons anyway. Cubase 3 should be OK on a stock Falcon, but there does not seem to be any data on the compatibility of Cubase Midi with CT60 on Rodolphe's site.

If your link above is to enable downloading of Cubase, then it must be a hacked version. Proper versions of Cubase need a copy-protection dongle. Hacked versions are known to be unstable as well as illegal.

If a software is not in the tested software list, it does not mean that it
is not compatible...it simply means that nobody was ok to try and/or report
to me a test !

I see no reason for a MIDI software to not be compatible with a falcon +
CT60.

Regards

Cubase2 does not work on TT-Atari Machines.

>

Illegal only due to aggressive Steinberg marketing. Thatďż˝s their fault.

Only because not many people do not drive a 1974 Mercedes Benz anymore,
I would not stop selling Gasoline to them. Or?

Itďż˝s a not normal company and I have not the slightest idea why they
donďż˝t sell the ATARI ST/TT/Falcon Versions they had and still have. A
60ďż˝s or 70ďż˝s Car is also not build anymore, eh!? And there are still
parts available for the ST/etc, and new parts too. e.g. CT60

I hope they will change their minds at Steinberg and make a fine ATARI
MIDI-Bundle with newest versions (maybe also a 060-checked version, why
not?) and any other you need, for the best MIDI Hardware I know. They
could only win, IMO. The Software is already finished!

I expect the ST or MegaST and STE works best at MIDI. We tried in the
mid 90ďż˝s how fast can the ST (1024ST, 1MB RAM, Floppy, SM124) play.....
well, that what I heard is faster than that, what three 'real bands'
could play. Although thatďż˝s good for nothing :-) but normally played it
(1040ST) sounded exceptionally. ATARI MIDI, what else?

Best Regards,

Daniel Mandic

Thanks for the reply.

I think there is a potential problem with Cubase Midi because it will not run if there is more than 14meg (I think) of ST RAM available. On my Hades it only runs if the memory is split so that any extra is TT ram - which I think Cubase MIDI ignores. If I run in Single TOS, with the memory suitably split, then Cubase runs excellently on the Hades.

I would like to find a 2nd-hand CT60 Falcon as an alternative machine, but it is important to me to know if Cubase runs OK before I buy one.

If I can arrange for someone to test it for me I'll let you know the results.

Paul

That's a shame. I sent them yesterday afternoon/early evening. I'd like
to be in touch with you about one of the machines. Any chance you could
e-mail a telephone number to: anna.wilNOSPAMliamson1@ntlworld.com ?

If it gets through to me I'll try and give you a call. Meanwhile, I'll
keep hoping my ISP will get their Pop3 server working....

Cheers

Paul (W)

5435. TT clock battery

Newsgroup: comp.sys.atari.st
Date: 2006-01-02 22:07:45 UTC
From: Starlord <starlord@despammed.com>
Message-ID: <c8idnXHxUIOmOSTeRVn-ug@inreach.com>

Took out the long dead battery today and no, radio shack doesn't have anything the same voltage. Closet batter is a 3.0 one. I was wondering if a pack of 2 or 4 AA or AAA batterys would work?

Hi all,

You could check a local Fry's electronics and pay about $16 US for
these or....

Here is a link that I ordered some batteries from a while back.

http://sescodatasystems.com/product_372_detailed.html

Be advised, thanks to homeland security, all batteries must go ground.
Be prepared to wait up to a week for delivery.

I've also used 3 or 4 AA batteries with good results. I usually put 3
in series or if i have 4 put one in parallel with one of the 3. If you
use rechargables, they will get you pretty close to 3.6 volts.

Even for those whose battery has not expired, you should replace them
at least every couple years. I've had one explode in my TT and it make
one H3LL of a mess. Luckily I was able to clean it up and the TT still
works like a champ. The only damage was to the back metal plate which
I neutralized the battery acid and wire brushed the metal. If
possible, mount the battery outside the computer.

You will know when and if your battery explodes... It has an awful
nasty smell like something is burning...

If anyone cares, all TT use the same timekeeping chip, and several
different OEM batteries.

The last time I looked up that chip, any voltage greater than 3 volts, and
less than 5.00 volts will work. The top limit is a function of the
circuit they are in. Over 5.125 volts may cause fatal damage.

So there are several differemt ways to power that chip. For mine, the
batteries come from DigiKey, and arrive in three or four days.

everything was said already. Only thing I can add is to mention nobody stops you to make new (CPU/GSXB/whatever)-based plugins since mxPlay is free software with open plugin format. So if you find it useful, go for it. If you aren't able to do them you have to find some programmer with the same point of view as yours since 99% people using real Atari hardware are happy to use DSP for music replay and CPU power for, let's say, FreeMiNT and GCC.

You know that it doesn't bother me. I already have other modplayers that
do the job. The thing is for you. I just say that new players that don't
work both on clones and ARAnyM are very limited usage. It's a pity.

(newsgroups have been down here - been trying to post this for 3 says!)

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

Hi Folks!

Following ST kit is up for grabs...

2x Atari STe (think one is 1Mb, other 4mb)
1x Atari STm (2.5mb RAM) Boxed
2x SM124 Monitors
1x SF354 Floppy Drive (No leads) Boxed
1x External Floppy Drive

All the kit is in good condition. The STm does have some slight
yellowing of the plastics. Sorry, no mice are included

Open to offers on the lot. Buyer takes all and will need to collect from
Lancashire (J27, M6)

Cheers,
Dave

5449. $25 dollar game prize...

>Sure it runs !
>
>I have at least 30 people who bought CT60 FOR CUBASE AUDIO !!
>
>So, if there would be a problem they would have told it to me, no ???

I am sure they would - but I am not talking about Cubase AUDIO.

Cubase AUDIO is NOT the same prg as Cubase MIDI. (Although Cubase Audio has MIDI functions within it.)

Cubase MIDI is also known not to be "cleanly" programmed, and has some known problems. For instance, when it runs on my Hades, it prevents access to the SCSI port. It also has a problem if there is too much ST ram available.

So, whilst I know Cubase AUDIO runs fine, I was looking for confirmation that Cubase MIDI also runs well. (I have been told that now.)

Cheers

Paul

5462. Laser printer for ST?

Newsgroup: comp.sys.atari.st
Date: 2006-01-06 18:39:00 UTC
From: Peter_Schneider@b.maus.de
Message-ID: <200601061939.a22437@b.maus.de>
Source record: 9840

Hi,

does anyone know a recent laser printer that will work on the parallel
port of an ordinary ST?
A friend of mine bought one (a HP 3xxx) and is unable to make it work,
though there is no problem if hooked to a PC.

As he is living 400 miles from me, I'm unable to give him real help by
the phone.

Any information concerning the HP 3000 series or about any laser
printer that definitely works with ST is welcome. The capability to
print graphics is undispensable because of Signum!2.

Thanks

Und TTschï¿½
ps

Additionally stealth.net doesn't work for many us users. Try
irc1.us.ircnet.net and us.ircnet.org. One of those always works from my
locations. And #atariscne on ircnet is the only place to be ;) Please
note the misspelling of "scene" is intentional (though I don't know how it
originated!)

Thanks,
Mark

IRC just must hate me, is all I can figure out. I seem to have the worst
luck trying to connect. Mark, I used the 2 servers you listed above and
got this for both:

--- Looking up newserver..
--- Unknown host. Maybe you misspelled it?
Cycling to next server in us.ircnet.org...
--- Disconnected ().
--- Looking up newserver..
--- Unknown host. Maybe you misspelled it?
Cycling to next server in us.ircnet.org...
--- Disconnected ().

```

Any ideas? Would love to join #atariscne again. Used to lurk there a lot back in the late 90's. :-)

I think there was an app that could be used with freeze dried years ago
on the Falcon. BUT it could only work up to 19,200. I can't remember
what it was called tho. Alzheimer's?

You may be correct.

BTW, Is a Driver required for a Iomega jaz or Zip Drive when using it
on a Atari ST-Falcon?

Or do these work, as is with HD Driver, or ExtenDos?

If a Driver is required, Did these types of Drives come with
an Atari Driver? (Which I doubt) Or where does one get
the correct driver at?

I have seen posts in this group in the past about using the JAZ and ZIP
drives with Ataris.

Does HD Driver see these Devices as Hard Drives?

I have never used one of these drives before, I know that they are
re-moveable.
I have heard folks refer to Cartridges when talking about these drives.
What type of Media do these actually use?

I may want to get one or two of these, if I can do D2D with them.
So any details one could pass along about these drives, especially
what software is needed to use them. Would be a big help.

Thanks,
PHANTOMM

5468. CUBASE AUDIO for Atari Falcon

Newsgroup: comp.sys.atari.st
Date: 2006-01-07 06:07:31 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <5SIvf.3914$qw4.49@bignews5.bellsouth.net>
Source record: 9845

Greetings,

Have a few Questions about Cubase Audio Falcon.

A while back I acquired a Original Box Set of Cubase Audio for the
Falcon.
All disks and manuals are Original. I have the Original Dongle and 2 DSP
Clocks.

Here are the titles of the disks......
Each disk has the original label with picture or etc.

These are in a folder in one of the 3
Ring NoteBook Manuals.

Cubase Audio Falcon
Cubase Audio Falcon 2.02
Atari Falcon Audio 2.06 Update
Cubase Falcon Additional-1
Cubase Falcon Additional-2

The Following are not in any type of order

Cubase Cue Trax
Cubase Falcon Dig. Interface v. 1.00.00
Steinberg/Jones Additionals 3
Cubase Studio Module
Cubase Program Disk v. 2.01.00
Cubase Program Disk v. 2.03.00
Cubase Atari Falcon 2.04 Program Disk
Creative Input Cubase Utilities
Cubase Score2.0 Additional 2
Steinberg M.M.C. IBM/ATARI
Steinberg's Cubase Utilities for Atari
Steinberg/Jones D Maker
Steinberg/Jones Atari Drum Patterns
Steinberg/Jones Additionals 1
Steinberg/Jones Additionals 2
Steinberg/Jones Studio Module 1.04
Cubase Studio Module
Cubase Additional Disk v.2.01.00
Cubase Atari Falcon Additional Disk
Steinberg M.ROS
Cubase Score

I have two 3 ring Original Manuals with Cubase Info and manuals from the various disks above. Also a Paperback manual for Cubase Score.

I've used Cubase before, with a DSP Clock, but most all of the disks I got in this boxed set are new to me.
I've not had time to read up on the manuals, or check out the disks.

Questions......

Is Cubase Score and Cubase Audio Falcon two different programs?

What is the latest version of Cubase Audio Falcon and Cubase Score if its a different program?

Can one still get updates to Cubase Audio Falcon and related programs from Steinberg?

Can one still get Cubase related hardware for the Falcon from Steinberg?

Correct me if I am wrong, but I think there is 2 versions of Cubase, one for the Falcon and one
for the Atari ST/STE/Mega?

If so, would like to know the latest versions of both.

Are there any Web Sites devoted to Cubase?

Also looking to buy or trade for the following Falcon hardware:
JamPRO
JamIN
JamOUT
FAD (Falcon Audio Digital)
Falcon Analog 4 or 8
SRC Sampler
Falcon S/PDIF DAT Interface

Any help is appreciated, E-mail me if you happen to have one or more of the above items for sale
or trade.

Not as far as I know. I have been in contact with them in the last few months
and have submitted 3 articles. I see they have not been releasing thr mag on a
monthly basis. I have some more articles planned anyway.

My Hades has the same printer port as a ST I believe. I was able to get my wife's HP LaserJet 2100 to work. I was using NVDI 5 which has a number of other HP Laserjet drives in it. I did not try any graphics, but the text came out fine.

Any HP that can be connected to the parallel port should work. According
to HP's specification the LaserJet 3000 does not have a parallel I/O
interface but only an USB interface. You can add a parellel HP EIO card
and can then connect the printer to the Atari's parallel port.

Check out ebay for the FDI:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7380339171&ssPageName=ADME:B:SS:US:1

2.06 is the last update for CAF from Steinberg and they no longer
support anything on the Atari Platform. It looks like you have
everything one would need for running Cubase on a Falcon. Score is Midi
only with no audio recording and I'm not sure if it will run on a
Falcon. CAF will only run on a Falcon.

Good Luck

Phantom wrote:

> BTW, Is a Driver required for a Iomega jaz or Zip Drive when using it
> on a Atari ST-Falcon?

Several hard disk drivers may work, but HDDRIVER is the only one
supporting special ZIP/JAZ functions like sleep mode or password protection.

> Does HD Driver see these Devices as Hard Drives?

Yes, just like any other removable media drive. ZIP/JAZ drives are
nothing special compared with other SCSI drives except for some
additional functions like password protection.

> I have heard folks refer to Cartridges when talking about these drives.
> What type of Media do these actually use?

The special removable media manufactured for these drives.

By the way, with the Falcon or an ST with IDE interface you can also use
the ATAPI version of the ZIP drive instead of the SCSI version. As far
as I can remember the ZIP was available for both SCSI and ATAPI.
You can *not* use the parallel port version.

Hello

I managed to find a bargain priced Falcon just before Christmas on Ebay (UK), it had a 'Buy now' of ï¿½125 so I brought it :-) after losing on several auctions as prices approached ï¿½300 recently, only downside is that it is French so the keyboard as AZERTY and only 1 MB of rma is onboard.

But now to my story of sadness.... all I can do is see a screen image (TV) as I have no Mouse, or a Falcon video Adapter would someone on here not too many hours from Hampshire, UK, let me pick up an Atari compatible mouse and an Atari Falcon Video adapter? give me a price as I'd love to get this going ASAP

Even better if someone has a 4 meg card for it as well

Thanks (don't reply to this)

Please email me at: Brookefamily 'at' mikeandtish.com

Hmm, okay. I guess I should have been more specific in my first post guys.
What I had in mind was the faster ports on a Mega STe. So would HSModem
intercept between, say BBS software hard-coded for serial port 1, and fool
that software into thinking its getting serial port 1 when its actually
one of the faster ports?

Thanks.

I was afraid of something like that. Charter seems to suck vacuum in some
aspects, but I love their hi-speed cable service, and its the only game in
town here (no DSL available). Heck, I even got a "you're blacklisted" msg
from Xchat one night just trying to logon to a couple of those servers.

>
>Guys, is there any software out there that will step in, take any software
>looking for serial port 1 and redirect it to another (faster) serial port?

Possibly. It all depends on the software that's writing to the serial port. If it's using the BIOS/XBIOS routines, it should be possible to alter the mapping of the serial devices so what it thinks is serial port 1 (MFP) is actually one of the faster ports on either a Falcon, a TT, or a Mega STE. In theory, it should be a very quick, and probably no more than 5 minute, SMOP[0][1]. Doesn't mean that it really will be though.

On the other hand, if it's writing straight to the MFP, bypassing the routines to gain a little extra speed, the answer is probably no.

[0] Small Matter Of Programming. The nice way of describing what to laymen should be simple job, but often turns out to be rather complex.

[1] I have an idea how this could be implemented, including a method of swapping back to the proper device layout, but no way to actually test this out[2]. My idea would be to swap the entries for the serial port 1 and the faster serial port in the Bconin_vec, Bconout_vec, Bconstat_vec, and Bcostat_vec tables. Setting a cookie, if one isn't already present, to show they've been swapped is probably a good idea as well.

[2] Both my Atari machines are in storage and not easily accessible.

Regards, And have a Happy New Year
David Bolt

5490. Atari BBS's

Newsgroup: comp.sys.atari.st
Date: 2006-01-07 23:05:32 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2006.01.07.23.05.31.611740@nosspamatari-source.com>
Source record: 9716

Hey everyone,

I've been looking around and it looks pretty definitive that there's a resurgence interest in BBS's in general and on Atari's. This is what I've learned as kind of a wrapup for other people.

There are several ways to connect an Atari BBS to the internet. One, at http://www.coldwinterknights.net is STiNGadel. I was a bit skeptical but this simplistic BBS is rather addictive in design and obviously reliable in that it's still up since the announcement back in July of 2005. Unlike other Atari BBS's it's truly multi-line and now multi-line on the internet.

Darkforce BBS is now up, telnet://bbs.darkforce.org. This is a BBS express BBS and uses a different strategy. Basically just a device that is a simulated modem that converts it to telnet. One side consists of a serial port, the other side is an ethernet cable. I think the device is setup with a web browser on a pc or something. This also works QUITE well and the darkforce BBS is alive right now.

Then there's my BBS, Atari-source.com BBS which was running on octopus bbs. If it ever comes back up, it'll be at telnet://bbs.atari-source.com. Now, I always liked Octopus because the ENTIRE BBS is fully scriptable using a VERY slick scripting language. It also fully supports fidonet mail AND I managed to compile the internet fido mailer, Binkd on my falcon and it works tested with fidotel bbs. Thus I expect to be able to bring the atari-source.com bbs back up sometime and actually be a full fido hub. Believe it or not, there's still atari activity in fido message groups.

Recoding octopus was my first C project ever. I have like 30 copies of the source lying around with different modifications and some of the code is not high quality, and the telnet conversion is only as finished as it needs to be for proof of concept purposes. I never tested the multi-line features (though octopus supports it!) and many things don't work. After my current work on SUM and http://dev.sparemint.org I'm going to go back to polishing octopus to be a useable product, then I'm going to make a web guide to kind of show off just how powerful it is. I don't think people even understand just how amazing of a bbs package this is. I'll also be using CVS as with GIM and SUM it's really helped out the development. I just have to figure out how to isolate that source from GNU source of GIM and SUM because Koos Kuil, the original author, wished for it to not be made GNU GPL even though it is now freeware.

One of the problem with telnet bbs's is the fact that the bbs is no longer using a modem. Most things interacting aren't designed for this. Thus you'll need a special internet mailer (which we have now) if you're going

to do that, and any doors or file transfer tools will need to understand and use the tcp connection. I don't even know if it's possible to hand off an open tcp connection from one application to another but I suspect it is!

Because of this, file transfer and doors don't work yet on octopus (and probably not on stingadel). Darkforce chose the perhaps cooler solution and converted the serial to ethernet directly so everything works, but he loses easy multi-line ability, and loses a very fast bbs made possible through telnet and direct ethernet.

So in addition to giving Kudos to the STingadel author and Ronald for their ingenuity, I just wanted to let people know that they can expect the following... eventually ;)

Octopus will have full internet based fido support with a guide.
It will have fully working internet based file transfers (for telnet terminals that support zmodem like hyperterminal).
I'll be making an installation guide for octopus on
http://www.atari-source.org
I don't even know what doors exist for the Atari but perhaps if we can't get our hands on the source code maybe the serial i/o can be redirected.

Anyway.. This is vintage cool for sure ;)

Thanks,
Mark

The app I mentioned could redirect. The Falcon does not have a low speed
(MFP) port. So this app redirected to serial 1 (SCC). However it did not
go beyond 19,200 (MFP speeds).
Hsmodem is only a serial port patch. use it in conjunction with
Steno/Stalker or similar you can talk to any avaliable port at full speed.

You can use a PC with any java compliant web browser, or you can also
telnet directly into the device through a local port. Both work great.

<snip>

Exactly. Thats the part I hate. Its also why I've been trying to find ways
to redirect serial port output/input. I've got a Mega STe, so I've got the
faster serial ports. The Lantronix UDS10 serial converter supports speeds
up to 115k so thats ready as well. I just can't figure out how to get my
software, BBS Express ST, which is hard-coded to serial port 1, to see the
faster ports. Of course this does not solve multi-line capability. I doubt
Express will ever do that.

> So in addition to giving Kudos to the STingadel author and Ronald for
> their ingenuity, I just wanted to let people know that they can expect the

Mark, you get Octopus doing all that and I'll be tempted to switch! :-)

BTW, I have to give credit where credit is due - the 8bit crowd from
comp.sys.atari.8bit are the ones who gave me the idea for using the
Lantronix UDS10, seems several there use it for their BBSs as well as for
directly FTP'ing and telneting with their trusty 'ole 8bits... :-)

<snip>

If you really want higher modem port speeds, see the Atari Workshop for an RSVE, from the author of HSmodem. Four wires to connect, three chips on a small board, and an ST will do 115200. This circuit, it is said, works for the Modem 1 Port of a MegaSTE or TT, which it should, since it connects to to the MFP. Yes, this is a top post. Get a bigger monitor.

That's interesting. Did you find any information on the available
interfaces of the 3000. I found that is does not have a parallel
interface but only USB, which would of course mean that you cannot use
it with an Atari regardless of the PCL level.

Like many of the HP printers there is a slot into which an optional
parallell adaptor can be plugged.
See:-

http://h20000.www2.hp.com/bizsupport/TechSupport/Document.jsp?lang=en&cc=us&objectID=c00491908

&

http://www.hp.com/hpinfo/newsroom/press/2005/051017a.html

It seems a bit odd but in many situations its better to have a network
interface on a printer rather than a centronics port

Last Cubase Audio update is 2.06.

> Can one still get updates to Cubase Audio Falcon and related programs
> from Steinberg?

No, for Steinberg, Atari computers is a very old story.

> Can one still get Cubase related hardware for the Falcon from Steinberg?

No, I don't think.

> Correct me if I am wrong, but I think there is 2 versions of Cubase, one
> for the Falcon and one
> for the Atari ST/STE/Mega?

Yes, Cubase Audio is very dedicated to the Falcon (except Cubase Audio for
CBX-D5).

> Any help is appreciated, E-mail me if you happen to have one or more of

> or trade.

I 've just bought an original Cubase Audio box and modified the Falcon
inputs.

I planned to enhance (hack) Cubase audio to provide new useful features for
me.
I 've already done a little patch which enables the 49170 Hz recording with
CAF.
But at the moment, I'm busy with Studio Son improvements...

A network interface has several advantages, e.g. higher speed, more
intelligence and, of course, if one has several computers they can all
use the same printer without depending on another computer acting as
printer server.

Currently, I'm working on Resampling and Filtering into Studio Son.
Now, my code is optimized enough to perform a quick treatement.
My work is done to work on 68030 and 56001.
The Resampling process is currently done with a Linear Interpolation
followed by an optionnal Digital Low Pass Filter.
This work is done with only one DSP program to increase the process.

The Filter optimization is remaining, but it's a simpliest version of
Resampling.

Also, I'm correcting little bugs of Studio Son.

For Cubase Audio, I have ideas but I don't want to tell more because it's a
future work.

I received requests about CT60, but at the moment, it's not my first
problem.

Saw some news coverage today of a new "Zero FootPrint PC" from a company called Cybernet being marketed at the 2006 Consumer Electronics Show. It is an all-in-one case design that I found quite reminiscent of the Atari ST/STE/Falcon. Yet another example of Atari computers being well ahead of their time?

Company webpage is at http://www.cybernetman.com/

Well, I'll reply here anyhow.

Atari mice are getting a bit hard to find and can be costly. A better idea is to use an Eiffel (http://satantronic.atari.sk/) or PeST (was here: http://www.cps-electronics.co.uk/web/closed.htm , but the site seems to be down -- try contacting "Exxos" on this forum) and a PS2 mouse.

As for a video adapter, note that there are two types -- ST monitor style and VGA monitor style. Best Electronics in California has both (as may others). There is a fellow on EBay from Poland (Jurekdudek) selling them for a little over $20US. (I have not done business with him myself).

Now to the memory card. 4Mb cards are pretty common -- in fact, I have one lying around. 14Mb cards are (at least were recently) being made here: http://www.volny.cz/boban07/RAM_kartice/ . They are around $50US.

If you fully outfit your Falcon with PeST/VGA/14Mb, you'll probably spend another $100US or so, but I think you'd find it worthwhile. Substituting a mouse from Ebay and a 4 Mb card from someone's spare box would probably cut your cost down to $50.

Galen

The ST case was *much* more stylish, I think! The really funny thing is
how the site seems to think that the design is so revolutionary! I
guess they've never seen an Atari, Commodore, or even an Apple computer
for that matter.

Yeah, I kind of see what you mean. Still, I like the ST/STe/Falcon look
better, but it is nice to see something like this. Who knows, maybe the
designers used to own or saw one of the Atari computers.

I have seen the docs on the Internet on one of the Atari sites. I wanted to get one of these, but never found one. It was a device that had a PC chip in it and allow an Atari to run PC programs or something like that. From what I remember there were two version, a 286 version and a 386 version.

The rear of the PC certainly reminds me of my Falcon.

Next a 'PCstacy' will come out.... oh yeah, they are here and called
laptops.

:)

HP printers that have PCL5 appear to work fine on Ataris, whose NVDI actually sends PCL3 and PCL4 compliant commands. (Of course, that means you need to have a parallel port.) PCL6 is not backwards compatible.

I use Brother Laser Printer, it does not understand the Epson codes from STWriter but will print normal pica. Marcel the other WP I use has no problem with this Brother printer.

Well, I'll reply here anyhow.

Atari mice are getting a bit hard to find and can be costly. A better idea is to use an Eiffel (http://satantronic.atari.sk/) or PeST (was here: http://www.cps-electronics.co.uk/web/closed.htm , but the site seems to be down -- try contacting "Exxos" on this forum) and a PS2 mouse.

As for a video adapter, note that there are two types -- ST monitor style and VGA monitor style. Best Electronics in California has both (as may others). There is a fellow on EBay from Poland (Jurekdudek) selling them for a little over $20US. (I have not done business with him myself).

Now to the memory card. 4Mb cards are pretty common -- in fact, I have one lying around. 14Mb cards are (at least were recently) being made here: http://www.volny.cz/boban07/RAM_kartice/ . They are around $50US.

If you fully outfit your Falcon with PeST/VGA/14Mb, you'll probably spend another $100US or so, but I think you'd find it worthwhile. Substituting a mouse from Ebay and a 4 Mb card from someone's spare box would probably cut your cost down to $50.

Galen

Just as a note, CPS site is closed down, Pest pages have been moved to http://pest.atari.org Other CPS based kits will also be moved over to atari.org when I get time :S

about 15 years ago I had a Atari ST 512. Which I upgraded to a the crazy 1024 mb ram.

I remember dreaming about gettinga harddisk for it?

What differnt harddisk were there??

If I want to get a new used Atari ST, what differnt harddisk should I look for?

Mikael

Hi Mikael! A hard disk is definitely a "dream" for the way your Atari computer will work.

Try to find a slightly older SCSI drive in an external case, with a power supply. Depending on what TOS version you wind up with, will determine how much of the drives space it can see/use.

To me, the the hardest part is finding a HD adapter/controller like ICDs Link2. They are no longer made, AFAIK.

If not that, perhaps you can find one of the older Atari branded models like the Megafile 20, 30, or 60. They are pretty old now but every now and then you can find one in good shape.

If you can get something like a Mega STE, Falcon, or one of the Atari clones, you will have a SCSI controller already onboard. The Mega STEs controller is somewhat limited though.

The Falcon and Atari clones can use IDE hard drives as well.

I'd check the For sale/swap places on Atari web sites, as well as the newsgroups and definitely Ebay. Always lots of different things on Ebay.

Yep, thats it. I've not taken it apart (yet) to see whats inside though.

Since I'm not familiar with it at all, I'd like to ask - does it take over
your whole system, in other words you boot into a DOS or Windows
environment, or can you boot up into Atari, as normal, and then access it?

Thanks much!

What model is your Brother printer? Until just recently the Brother
had IBM Proprinter and PCL 4 emulation. Also, are you using NVDI?

(Note: Modern Brother printers have only PCL 6 emulation. I do not
know how compatible that is with Ataris.)

You boot under TOS. Then, at any time you like, you launch ABIO.TOS and
you boot your Supercharger under MS-DOS (you can have a dos partition with
the PC system on it or just boot with floppies).
Under DOS you have a key combination or a little tool called TOS.COM to
go back to Atari. And then, next time you run ABIO.TOS you find your
supercharger in the same state as you left it: under dos or windows.
If you use ABIO.ACC, when you swap from PC to Atari, the PC goes on
working (no pause!).

Guillaume.

For those reading this with passion (hem...) the Supercharger can emulate CGA and Hercules Graphics. But, disassembling the software, I could see that the "Olivetti" graphic mode was planned to be supported. Never ended... You can try SETVIDEO C (for CGA), SETVIDEO H (for hercules) but also the undocumented SETVIDEO O (for olivetti).

Guillaume.

As discussed earlier its not good. You need PCL5 or less. PCL6 is not
backwords compatible.

It you can find a Link2 then you could hook any SCSI drive to your ST with
ease. I have one for my STe and it has been working great for about 4 years
now.

One neat feature of the supercharger is that the Ram in the supercharger
its self can be used
in normal Atari mode, for a RAM Disk or whatever.

You can have a 4meg machine and use the 512K in the SuperCharger as a
Ram Disk.

There is also a socket for a Co-Processor.
I used one out of a old 286 computer in mine. I don't have the 286
upgrade, but would like
to find one, or a 386/486 if they were made. I have seen advertisements
for the sell of
the 386 and 486 versions. But don't know if they were ever made.

I have the original disks and manual which is fairly thick.
I've used it some, but mostly use the FalconSpeed board or ATonce 386SX
in my MegaSTe.

Just to be a bit more precise: The Link2 only supports SCSI devices that
do not require the computer to have a SCSI ID of its own. It will work
with most devices, but there are some that expect the computer to have a
SCSI ID, e.g. some optical memory devices, but also some hard disk
drives manufactured by IBM and Quantum (and probably others). These
devices will only work with a LINK96 or LINK97 adapter.

Yes, it does, and the Falcon's SCSI hardware does as well, but in both cases hardware support is not enough. Initiator identification must also be supported by the hard disk driver. That's the reason why TT and Falcon cannot boot from drives that require initiator identification. The initial question was referring to a hard disk for the ST, and for the ST the choice of the Link adapter matters.

Don't know if it even works or not, just got the software from another helpful Atarian, but yep, I got one.

Odd too - I won an auction on Ebay for some Atari magazines and the guy threw in a bunch of extra stuff, like a Migraph hand scanner, Golden Image finger/pointer scanner with DPaint 3 from EA, and the Supercharger.

Love when that happens. :-)

Hi Mikael,

Exxos and I have some things Atari hard disk related in the pipeline. Time, enthusiasm, and other commitments being the main stumbling block at the moment.

We're aiming for a transparant IDE interface to begin with. The IDE/CF coding is firmware/hardware complete, and the ACSI side is mostly hardware completed, the firmware coding still has to be finished. The SCSI bit comes next but is relatively straightforward. Most of the IDE/SCSI implementation is quite straightforward as once the electrical side of getting the commands/data back and forth is established, it's literally just a case of getting things in the right places at the right times and converting responses between the differing standards. Data is easy, the responses are a little more involved. The one I'm stuck on at the moment with standard ACSI (not hosted SCSI Uwe) is how the drive size and specs are determined, I'm guessing this is coded into the boot block. Time is the limiting factor as well as moving house atm.

Once we have finally developed the skills here the original project can be expanded upon.

There are things happening out there Mikael but with stumbling blocks and lack of hardware side documentation, as well as lots-of-enthusiastic-brains on the job, it's slow progress.

eBay is definitely the place to watch for the time being though. :-)

Remember what I (I think) I mentioned about determining the size of
drives connected to the ACSI bus: The hard disk driver will take care of
this, and it is not the concern of the ACSI-related hardware to
provide any special functions for this.
All you have to do is implement the ACSI/SCSI command set, anything else
will be handled by the hard disk drivers.

Yes but there is no ACSI command for determining drive size. Let's assume
that we're not going to be using your drivers for a moment, so no SCSI
support, just a plain old RLL on the end of the controller running with
Atari's bog standard implementation. Bug free or not it can still determine
the size of that drive when there is no documented
electrical-sequence-of-1's-and-0s to do it.

I can't implement a 3rd party hardware solution if the computer throws
something at it and it doesn't repond correctly. With most of these
hardware things alot of it is trial and error as manufacturers will fall
back on their drivers at every turn. ie, Implementing a wireless solution
with the custom chips out there has to be one of the hardest things to do as
the manufacturers insist that you pay extorniate investment fees to their
name, and then the documentation you receive is non-existant, read the
sci.electronics groups. The corporate market is not open and is highly
protective of it's internal interfacing and source code. If I was a
gigantic manufacturer I'd have paid Atari £250,000 for detailed hardware
documentation and would have finished this 3 months ago.

It's a bit like putting a teenage driver in a car with no wheels on it.

I'm at the point now where I just couldn't care less after banging my head
against a wall, hence, no interface. If it's that simple then I'd be
grateful if someone else would do it and I'll pay them £50 for a little
retail box which requires no soldering, programming of GAL chips and

fiddling about. Just something which plugs into that ACSI port and gives me
mass storage without third party drivers and specialist hacks.

I have no enthusiasm to do this anymore when all that ends up is argument
without facts.

To add to this, <calms down>, if the Atari drivers issue a command of '1'
for example, then I have to tell my interface what to do. It's more that
for each of the ACSI/SCSI commands I have to 'interface' these to whatever
mass storage device is on the other end. So I need to know EXACTLY what
data and commands are going back and forth, and I have to entirely
understand those commands explicitly. If I can't calculate every possible
eventuality or possible blip then the interface will be unreliable with some
byte at some point amongst billions of transferred bytes. This is not
acceptable.

No it can't. For RLL onto ASCI there was a noxious file that contained the
cyl/track/sector data for each type of drive.
How it got encoded onto the drive I don't know, but it did. I don't have a
SCSI (actually SASI) to MFM/RLL controller any more to experiment!

Don't know if this is still there or not, but Best Electronics has this
listed:

"Atari ST SCSI Adapter Cable This 2 1/2 foot DB19 Male to DB50 pin SCSI
adapter cable has the required interface electronics molded into the DB50
connector end of the cable. This cable will allow you to connect up to
your Atari ST systems most SCSI devices like Hard Drives and CD ROM's.
This adapter cable requires that Parity be disabled and 5 volt be present
on pin #26 of the SCSI device you are going to connect up to your Atari ST
system. This adapter cable works with the latest versions of Atari HDX 5
or above, ExtendDOS and so on. Adapter cable only, with no software.
CB102773 $75.00"

and in their hard driver section:

"For Atari 520ST/520STFM/1040ST/Mega 2 - 4/Stacy/MegaSTE/TT Computers,
External SCSI Hard Drives! These Best External ST Hard Drives are
Manufactured by Best Electronics using Recycled External Drive cases and
"Pulled" from Working Equipment Hard Drive Mechanisms! Each External Hard
Drive is "Lock and Load" Ready to plug into your ST DB19 pin External Hard
Drive port! Hard Drive Capacities in stock range from 200 - 500 Megabytes
to 1 Gig! Atari ST External Hard Drive case with internal Power
Supply/Fan, 110 Volt Power Cord, SCSI In and Out Connectors, 2 1/2 foot
SCSI Adapter Cable (with built interface electronics) to Atari DMA Port.
When you order, please tell us which ST Computer/TOS you have, so we can
Customize the Hard Drive Boot Software to your exact ST System. CB103091
CALL or E-Mail"

HTHs.

> > determined,

But there is a SCSI command that returns the drive size.
(And other info, I think)

Of course, that's SCSI., not ACSI... But... I think
most Atari HD driver software probably deals in SCSI
commands, and not ACSI as such.

Which commands are available is determined 100%
by the hardware that is connected. So... If you have
a SCSI drive connected to the ACSI port via a host adapator,
(as far as I know) the host adaptor will simply pass through
any commands directly to the SCSI drive. So, it's the SCSI
drive which interprets and responds to commands.

So, Ali... here's a thought for you. Find a SCSI
drive that works with the (free) HD Driver of your choice,
then find out what SCSI commands that drive provides,
then provide the same set of commands.

You might even get away with just the standard
ACSI commands plus, maybe.. the Read Capacity
command. But.. Read Capacity is a 10 byte command,
so I don't know if that will actually work. Actually,
I can't see why it wouldn't... hmm. It's been too long ;)

> > electrical-sequence-of-1's-and-0s to do it.
> >

I agree with the Dr. There never was an ACSI command
drive size, probably because when the ACSI command set
was made the drives didn't know their own size.

ACSI never changed, but SUPRA/ICD etc. simply
started using 'proper' SCSI commands as the drives

that supported them came into use.

So.. It's only a software issue.. If your hardware
emulates a basic SCSI command set (less basic that ACSI,
though) then any decent HD driver should be able to
access your hardware.

The ICD software came with a little utility that
I assume ICD had first written for in-house use.
It allows you to send *any* SCSI command to
any device and observe the results and sense data.

This does not matter. If your hardware implements all the mandatory SCSI commands that can be executed by devices connected to the ACSI port (i.e. the lower SCSI command classes) there is nothing more to do on your side. The hard disk driver software will take care of the rest.

The mandatory commands for hard disk devices listed in the SCSI-3 specification and available with ACSI are: $01, $03, $04, $08, $0A, $12, $1B, $1D, $1E. Those only available with real SCSI are: $25, $28, $2A, $2F, $35.
So for an ACSI emulation only 9 commands have to be implemented and $25 (READ CAPACITY) is not needed at all. Note, however, that with these 9 commands you can only access the first GByte of a drive. In order to access more than that you also have to implement the other 5 commands. If you do not do this and your hardware only supports 1 GByte I doubt that there will be much interest in it because current IDE drives are much larger and most users will want to access more than just the first GByte.

Actually I cannot say more than that because it's as easy as that. You are thinking about issues that will be handled by the hard disk driver software and do not have to be handled by your hardware. The only thing your hardware is responsible for is properly implementing the mandatory SCSI commands and it must properly refuse (correct SCSI error message) any non-mandatory command that is not implemented. Everything else will work then.

It's easier than that: Any SCSI drive must implement the mandatory hard disk device SCSI commands listed in the SCSI specification. I have listed them in my last posting. These are the commands HDDRIVER and other drivers use.

> You might even get away with just the standard
> ACSI commands plus, maybe.. the Read Capacity
> command. But.. Read Capacity is a 10 byte command,
> so I don't know if that will actually work. Actually,
> I can't see why it wouldn't... hmm. It's been too long ;)

It does not work with ACSI unless one is using a Link compatible adapter. But even without this command hard disk software is able to determine the drive size.
But let me say this once again: The 10-byte-SCSI-commands are required to access more than 1 GByte of a drive.

> The ICD software came with a little utility that
> I assume ICD had first written for in-house use.
> It allows you to send *any* SCSI command to
> any device and observe the results and sense data.

You can also do that with the SCSI Driver interface implemented by HDDRIVER and CBHD. HDDRIVER even includes a tool that lists commands and their results using SYS_MON.
There is no need at all to guess these commands, though, because the SCSI specification explains them in detail and also lists the commands that have to be implemented.

In the last two years or so three people have contacted me because they wanted to design an IDE to SCSI/ACSI converter. None of them was willing to have a close look at the IDE and SCSI specifications. This is bad because without thorough knowledge about these protocols one cannot design the required hardware.
All that I could say about the requirements (and much more that is relevant) is listed in detail in those documentations. They are the reference, not a piece of software like HDDRIVER. HDDRIVER, like any other driver, does nothing more but rely on the propler implementation of these commands.

Finally note that an application may send any SCSI command to a hard disk driver using the SCSI Driver. This means it is not sufficient to implement your own choice of commands instead of what the SCSI specification mandates. An adapter must cops with any command, execute those that are mandatory properly, and refuse those that are not implemented properly, i.e. with a proper SCSI error message.

Sorry for step into (I'm a layman) but I would like to learn ;) You are saying that commands $25, $28, $2A, $2F, $35 which are not in the ACSI standard can be sent to any hardware through the ACSI port aren't you? And it doesn't matter how the drivers determine the disk sizes, if the hardware can respond to these commands (plus the ACSI ones) then everything will be fine.

I'm coming around to your way of thinking Uwe, in that just forgetting the strict ACSI adherance and going for the subset which includes the basic and additional commands.

From a financial standpoint I stand to recoup my costs if releasing a standard SCSI host adapter per-se, as opposed to an IDE hybrid. That doesn't stop me writing a version which manages a low-cost SCSI <> IDE adapter however, which allows a CF card slot to be hidden in the 'casing'.

My real aim here is to be able to use my ST for MIDI without having to listen to a HDD. As for buying a Link2, far far too expensive.

A new readily available SCSI host adapter with 'extras', with the code at hand, and which isn't sold at prices bordering on extortion. Nice thought.. We're onto the high-MIPS microcontrollers now with lots of I/O so we've sorted that one out.

The extortionate prices are only charged by those trying to make a living
or supplement their income on these low volume production runs. The only
reason the Link's are so expensive now is because they're rare and
everyone knows it. Laws of supply and demand are such a pain ;)

Hey guys,

I don't know if you've ever seen the M5485EVB but it's the motorola evaluation board system. It's just an IO setup in a nice Mini ITX form factor. Comes with Ethernet, PCI, USB 2.0, graphics chipset and more. It takes several different configurations of Coldfire chip + RAM on system on chip modules.
The whole shebang costs between $900 and $1200 with different options.

Now understand, I love the idea of a home-made coldfire machine that solves our needs perfectly, but MiNT already runs on the evaluation hardware... Why not just call this evaluation board a hardware platform for us? It boots linux too ;) Why not just have everyone buy this.. Perhaps we could get a run of 100 of them at discount from motorola. Seems easy enough to me. Why waste years and years in unnecessary hardware development? Or do people do the hardware because they're afraid of the software ;)

Thanks,
Mark

No, not by any hardware, but only by adapters comptable to the ICD Link,
like LiNK96/97. These adapters implement a proprietary protocol
extension, which provides for sending any SCSI command via ACSI.
Additionally, the hard disk driver must support this proprietary method,
i.e. you need both: An ICD compatible adapter and the software that
knows how the proprietary protocol works. Information about this
protocol is readily available, everybody who has contacted me knows
about it. It is quite simple: If one wants to send a 10-or-more-byte
command one simply send an additional byte $1F as the first command
byte, followed by the actual command bytes. This way any SCSI command
can be sent via ACSI, but this only works with ICD compatible adapters.

HDDRIVER makes use of this proprietary extension, and other drivers to
as well. Most drivers do, actually, except AHDI.

> And it doesn't matter how the drivers determine the disk sizes, if the
> hardware can respond to these commands (plus the ACSI ones) then

Everything will even be fine without these additional commands. In other
words: If a hard disk driver wants to determine the disk size it can do
so without these additional commands. But a hard disk driver can *not*
access more than the first GByte of a drive with these additional commands.

Just go for SCSI as far as the command set is concerned, forget ACSI.
ACSI is only relevant in terms of the bus protocol required by the
hardware. The software protocol is irrelevant, i.e. there is no use in
trying to mimic the behavior of RLL drives.

The fact that several people have tried to design Link adapters or
IDE/SCSI adapters of their own for the last few years, but nobody of
them has yet presented a working device, shows that this is probably not
so trivial. The Link adapters are most likely worth their price.

> What about the TT interface. As this is "real scsi" can these commands be
> sent?

Yes, TT and Falcon (and the Milan as well) have a standard SCSI
interface. Any command can be sent without restriction. They also
support receiving of SCSI commands. You can, for instance, connect two
TTs/Falcons to the same bus (with different SCSI ID, of course) and then
can send SCSI commands from one computer to the other. The SCSI Driver
specification covers this topic. HDDRIVER is the only driver, though,
implementing this feature.
The simplest use of this feature can be observed if you reboot one of
the computers. Assume that you have connected a TT and a Falcon via SCSI
and you reboot the TT. In this case HDDRIVER running on the Falcon will
not only display the available hard disk drives, but it will also
detected the TT and display it like any other SCSI device. The same
applies when running HDDRUTIL's ID check. In the HDDRIVER 8 manual there
is a screenshot showing the output. (In the Device Check chapter.)
Something like this is displayed by the Falcon if the Falcon has SCSI ID
6 and the TT has SCSI ID 7:

```
Bus 1: Atari SCSI
00:00: QUANTUM TRB850S 0403 Direct Access
06:00: Atari Falcon HDDRIVER 0817 Processor
07:00: Atari TT HDDRIVER 0817 Processor
```

All in all one can implement proprietary SCSI commands with this
feature, e.g. for a SCSI network. Nobody has ever shown any interest in
this, though.

Ronald J. Hall wrote:

> I bet it would be pretty fast too, wouldn't it!

Yes, it would be the fastest possible network for TT and Falcon because
the SCSI bus is the fastest interface both have in common.
It would not work for any other Atari machine, though, because the only
existing implementation for the SCSI Driver's target interface are the
one in HDDRIVER for TT and Falcon. The restricted ACSI hardware does not
support this feature, and as far as the Milan is concerned the Milan's
SCSI Driver does not implement it.
In any case, writing code using this feature requires profound knowledge
in the SCSI protocol in order to properly implement the code required
for the callbacks called during the SCSI interrupt.

Well now you can't be serious right? ACP machine will probably cost $1200
right? (even though the CPU itself is $25). EVB is $930 and best SOM
(5485 with MMU and 200MHz) is $365 (or $390). This makes total price of:
$1295. How much cheaper can a custom solution go?

I would happily pay that amount for such a machine.

I dont care abour the casing. I probably will screw the bourd
on top of my desk and put a glass bowl over it.

I threw out some adscsi ICD adapters just yesterday - thought no-one
would want one any more, never used in their boxes too.

Yeah I mean. I know it seems steep, but people perfectly happily pay
$800 plus for a PC or $3000 for a mac. Is $1300 really unreasonable?

I say hell yeah, why not declare this a supported platform and build
a software foundation for coldfire while the real machine is being
built.

People who think the price is too steep can just not buy it and wait
to support hardware developers.. And everyone with the cash to buy
the EVB will buy the acp anyway ;) I know I probably would...
but then I like to sell stuff to finance these things.

Thanks,
Mark

Yes, it is possible to connect an Atari ST(e) to a PC VGA monitor. For use in color, I use an old piece of Atari hardware called Video Key. It connects to the ST and has a composite-video out port on it. I just connect that to a video converter and from there to a PC monitor. It works fine for low and med res, but for high res there is a simple adaptor that plugs right into the ST that goes directly to the PC monitor. That works great also.

Again, you lucky dog. I tried so hard to get one of those and just could not find one available. Now, on the Hades, I use Software PC and that work fine. It will run most any 286 and some 386 applications.

Well I hooked my wife's HP2100 to my Hades which has the same printer port on a ST and it worked. Of course I was using NVDI 5 and a generic HP laser printer driver that is supplied with NVDI 5. The text came out fine, but did not try to print any graphics. A ST can run NVDI 5, so that may be an option for you.

Yes you can, you will need an ST-VGA adaptor and you will only be able to
use High resolution.
Several Atari outlets stock them, the first one that comes to mind is Atari
Workshop http://www.atari-workshop.co.uk or check with you usual Atari
supplier.

I think you can use a ST-high res with a small adapter with a normal PC
monitor, if you want med or low then you will either need a scan converter
box or a multisync monitor which supports 15khz scanrates.

To everyone,
I could not agree more with everyone in this post. It is long overdue that we have some sort of major hardware revamping. Who ever comes out with the first Atari replacement will most likely be the first to get my money. Course I would make a more educated decision once one of these computers is out and see how completion is coming on the other computer as well. But I have supported the Falcon upgrades right down to CTPCI or the Supervidel and will continue to do so even if an Atari clone replacement comes out. I have every piece of new hardware that has come out in DUPLICATE (YES thats twice!!!) And plan to never give up any of this hardware at all. But I would pay 1200 or 1300 for a new computer as well. But if Rodolphe can do it for half or even less than that GREAT you have my money Rodolphe. COUNT ME IN!!!!

Thanks,

--

About the Supercharger 286,

It was called "SCplus 286", and made by the same Beta Systems team.
Here are three pictures of it:
1) http://perso.wanadoo.fr/gtello/scplus_c.jpg
the old mother board on the left with the NEC V30 off and replaced by a
connector to the two daughter boards on the right.

2) http://perso.wanadoo.fr/gtello/scplus_b.jpg
the first part of the daughter board, a kinf of interface between the NEC
V30 logic and the 286 one?

3) http://perso.wanadoo.fr/gtello/scplus_a.jpg
the second aprt of the daughter board with, in the upper left corner the FPU
287 and maybe, the 286 (the square on the left with no marks on it).

The guy who owns this piece of hardware told me that it doesn't work. A
pity!

Guillaume.

????

I read here that your price is 1200 $
Very expensive !

I cannot think that some of you are rady to pay a such amount for just a CF machine.

OK, the CF CPU is around 30$...

I consider that a good price should be less than 300 $.

If you can go under 300$ at Freescale, that's good...
If not, you can buy it at 1200$ but this will never be an official replacement of the atari...because 99% of the atarians will not be able to pay a such amount of money .

Just for your info, I was already spoken with Didier Mequignon about how to do a atari machine clone in the better and faster way around a CF...
Some things have been decided... (by example to put the old MFP chip to reduce the work on the TOS !).
Now I need time to check all ideas from several developers...and select some technologic choices...
I have good contacts with some big US brockers...to get CF, MFP, DSP and other things at a good price...

Now it will nextly be time to work !

Who is ready to work with me to help on software, documentation, communication...and so on... ??

Regards

The CT63 are ready : I will get them in few days...
The 060 were localised and ordered... Should be here the first week of February.

So, the shipping of the orders will begin in February...
As always, you will receive an email when your packet is shipped.

Bye

You can count me in. I will help with FreeMiNT/XaAES for sure.

The past few weeks I've been going back on forth on getting a PegasosII machine, with only one target in mind, to port FreeMiNT/XaAES. And now that this design is open and downloadable from Power.org, perhaps it can be used? And if there is one dude who can, it is you, Rodolphe.

Ofcourse, porting our system to a PPC is a lot of work, I think a lot more than a CF based machine would require. But the net result will be a better faster hardware-base I think. How do you, and others, feel about that?

In anycase, we need new hardware! So I would welcome any new hardware
that can provide us with a 'new hope'...

Best Regards,
Odd Skancke

It would probably help everyone reply to you if you told us what Atari you have, if you have a HD, how much RAM, etc, etc. (if you already posted this and I missed it - I apologise).

Using software like STing and an external serial modem is how many do it for direct dial-up.

If you're not talking about dial-up, then there are several more options.

You can use a Lantronix UDS10 serial to LAN converter box to do text, like ftp, telnet, etc... Its a bit expensive though.

Rory sells the EtherNEC - a network card in a box, that plugs into the cartridge port of any ST, TT, or Falcon. Its quite a bit faster than dial up speeds, but not as fast as a true network card connection.

If you have a CT60, the EtherNAT will be out soon that will offer true network card speeds.

There are other options as well - I'm sure others will post them here.

Once connected, you can use software like CAB or Highwire to browse, Newsie for newsgroups, Mymail or Newsie for mail, AtarIRC, AtarICQ, and other good software.

HTHs.

> And what about graphics?
>
> Thank you for any information

The HP website notes DOS compatibility, PCL5e, and a parallel port, so it should work. (These are typically the three things you look for.) A basic ST should be able to get text output in a typewriter style font, and should make use of those programs that have "HP Laser" or "HP Deskjet" drivers. Add NVDI or SpeedoGDos and the printer should be able to handle most Atari programs. (The exceptions are those that assume an Epson 9-pin is attached. Fortunately, these programs are usually pre-1990 and thus are now rarely used.)

P.S.: If you buy it, please post if it works. I'm 95% certain it will, but I haven't checked a recent HP printer personally.

Galen

> still get high resoultion?
>
> Mikael
>

As others have said yes, you can get hi-res fairly easily.. However if you want to play games then a CRT based PC monitor is no good on its own. What you really need is something that runs TV type Video, preferably via RGB. You can then get (or make) an Atari Video to "scart" lead. I use an Phillips CM8833, but there are several other monitors available. I guess something like this

http://www.microdirect.co.uk/ProductInfo.aspx?ProductID=9359&GroupID=420

not sure to wacth the response ....

Other options are are an external TV RGB to VGA converter, but these seem both rare and expensive.You can also use a video capture device to route the video through a PC. Whilst these work, you don't always get a goos picture....

Hope this helps,

Dave.

I'll extend AHCC with a CF target, not too difficult.
Using AHCC would mean that CF software could be produced
on a TT.

I would be happy to help with documentation or simple coding. I can't do
anything complex unfortunately. I can do lots of mint development
and help with a CF optimized mint distribution.

Thanks,
Mark

> Anyone else try?

To further add to this interesting ideal.

1. The M5485EVB is Mini ITX form factor which means it will fit in an
absolutely huge amount of available cases.
2. The M5485EVB - which I thought was just the evaluation board itself
ALSO COMES WITH the M5845CFE. This is a 200MHz (equal to the M5475 266MHz
in power) coldfire SOM with 64MB of DDR and 16MB of flash, as well as
a graphics controller and USB Host.

This means the total cost for the coldfire system is $850.

The only PROBLEM I see with this system is that there doesn't seem to be a way to get it with more than 64MB of ram.. still 64MB is a good start.

Thanks,
Mark

> The past few weeks I've been going back on forth on getting a PegasosII
> machine, with only one target in mind, to port FreeMiNT/XaAES.
> Ofcourse, porting our system to a PPC is a lot of work, ...

I had made my own thougts about making a Atari environment with the
pegasos board. But my goal was to reuse as much code as possible to
spare time. As a result a have a different way:

I glue together linux drivers (for bios), a little bit oy my own code and the
emulator of aranym. Inside the emulator i will run EmuTOS without BIOS
and XBIOS. The BIOS trap will be handled instead of my own code which
calls the linux drivers. With this way i can reuse much of the still existing
linux drivers.

Inside this "Atari" i can run FreeMiNT from EmuTOS. I see no reason why
to start with MiNT because MiNT contains no drivers (no BIOS). The same
is with the AES. Because these parts are hardware independant, we can
leave a port of this parts for a later version. In my opinion it is much more
important to have a base for access the hardware.

Best Regards
Michael

Sorry for the low-quality picture, but this should still give everyone an idea about what my Falcon looks like now, after some "minor" changes:

Wizztronics rack case
425 watt ATX PS
CT60 @ 95mhz
256 megs SDRAM
16 megs ST RAM
Wizztronics IDE HD controller
80 gig Maxtor HD
Plextor 4/12/32 CDRW
DEKA keyboard interface
FreeKeys case
NEC 3D multisync monitor (with multisync gizmo)
Running MINT/Thing

I wired everything so that controls like the on/off switch, CT60 on/off switch, reset button, power and HD LEDs are all up front on the case.

Using Krylon Fuzion paint for plastic (as recommended here and at Atariage), I painted the monitor, keyboard case, floppy drive faceplate, and CDRW faceplate.

My wife is jealous of the attention it has gotten/gets...

I like it. :-)

First time I have ever seen a 286 version.

They did advertise a 386 and even a 486 version.
Wonder if those were ever made.
From the first photo, I can't tell if he has a 512K version or a 1 meg
version.
I notice that there are only 4 Ram chips on the main board.
The one I have has chips in all the sockets. I think I have a 1meg
version.
It has been awhile since I have used it. I do have it setup on a hard
drive, along
with the Spectre GCR software. Up on boot up, you can choose from a
menu to
run DOS, MAC system 6, or TOS. (With the Spectre GCR cart installed).

I have used it on a 4meg 1040 STe TOS 1.62 and it works well.
It would be possible to access the Net with the SuperCharger in DOS
using
Net Tamer. There is a version for pre-286 chips, as well as a 286, and
a 386/486

version. It does E-Mail, FTP, News, TelNet, and Web in Text mode.
I think there is a Graphic version for Web Browsing if you are using a
386 or better.

It's been awhile since I have used it, but its a interesting program to
use on a Atari ST-
Falcon with a PC hardware board.

So did I. I tried breaking a 12v that was in the harness leading to the CT60 but that didn't work. What would happen was that the I could turn the switch on and sometimes the CT60 would come on, sometimes it wouldn't. Also for turning it off - sometimes it would go off and sometimes it wouldn't. Many times the switch would wind up in an on or off position, but the state of the machine would be just the opposite. Also, if the power went off to the machine from the outlet (say a power outage or even unplugging it/plugging it in) then the computer would come on.

What I finally did was this, I opened up the ATX power supply case itself, (unplugged of course - important safety tip!), and there you'll find 3 wires coming in, 2 hots and the ground. The on/off switch thats built into the power supply itself breaks one hot lead. I ran 2 wires from the on/off switch on the Wizztronics case into the power supply and broke the other hot lead. This way, its a true ON/OFF to the CT60. It works great like this.

I'm sorry for the very non-technical description - I'm not an electrician but this does work for me.

If you like, I could take it apart, take a picture, and e-mail it to you?

Just let me know! :-)

Here's some instructions from a well known Atarian (lightly edited) on
how to make a cable. It is also possible to purchase these from
several sources as has been previously noted.

Galen

- - - - -
Atari ST to VGA adapter

Claes Holmerup
17 Aug 1998

You can use an SVGA monitor with an adapter cable (which is rather easy

to assemble) to get a monochrome picture. Some old VGA monitors may
work,
but all SVGA should work as far as I know.

Here's how you make your adapter:

Atari (13-pin DIN) SVGA (15-pin HD D-type)
------------------ -----------------------
11 (Monochrome output) 1,2,3 (Red, Green, Blue inputs)**
12 (Vertical sync) 14 (Vertical sync)
9 (Horizontal sync) 13 (Horizontal sync)
13 (Ground) 4,5,6,7,8,10,11 (Various grounds)
4 (Monochrome detect) short to ground (pin 13 on ST)

The trick here is that the monochrome signal is fed to all the inputs
on
the SVGA-monitor, which gives you a very nice monochrome picture. Even
though the monitor in fact is a color monitor, you won't be able to see

a color picture because of the construction of the computer (and the
monitor). If you get your hands on a monitor which handles frequencies
down to 15kHz, it's a whole new deal - then you should be able to build

yourself a cable with a switch between mono and color (a little more
complicated, involving a 4-way switch, but possible all the same). Just

about no modern monitors go lower than 30kHz, so in most cases there is

no other choice than mono - but since most useful programs (IMHO) run
in
monochrome, it's the best alternative anyway...

Good luck!
Claes

**Editor's Note: The ST output is a bit higher than the 0.7V expected by the VGA monitor, so some sets of instructions call for an inline 4K7 resistor. If your monitor can handle 1V input (most modern ones can), the resistor is not needed.

I wired the power switch directly to the CT60 and quickly switch the switch on and then off. The CT60 notices the change and turns itself on or off as required.

5652. New Desktop

Newsgroup: comp.sys.atari.st
Date: 2006-01-19 02:58:30 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2006.01.19.02.58.30.696670@nosspamatari-source.com>
Source record: 9629

Hello guys,

I wanted to write up a little post on my interest in starting a new desktop. I think that even Jinnee leaves much to be desired for our file interaction and the desktop is truly the heart and soul of the atari experience. Jinnee is in my opinion the best we have, but it is expensive, not free, and likely not going to be developed further.

Now we have teradesk. An open source desktop. It's truly great in my opinion, rock solid, small footprint, and fills a void on older constrained systems. This is why I think a teradesk fork is what the doctor ordered.

Tentatively, I think the name xDesk is pretty cool. I'd like to bundle it or tie it to XaAES as much as possible, as I really like the feel of a truly unified GUI. Now that we have the CT60, there's virtually no limit to memory consumption. It should be small and fast but quite featureful using XFCE as a kind of model.

Some things I would like to see:
Truecolor desktop backgrounds in any format using zView codecs to render.
Truecolor icons in any format, but most importantly truecolor SVG and PNG. I would tend to want a stock icon set of the tango project as, quite frankly, they're gorgeous: http://tango-project.org/Tango_Desktop_Project

With the exception of drives which are links, the desktop will house REAL files and REAL folders and will be /users_home_folder/Desktop just like on gnome.

SVG has the added benefit of producing icons that look good now at 640x480 and later when we have larger resolutions on falcons. (or on Aranym, Hades and Milan).

The icons should also be anti-aliased if it helps their appearance.

3 styles of navigation.. OSX style with the multipaned window view, Nautilus/Atari style spatial navigation, and a full featured browser style navigation. The navigation styles could be loaded via plugins to reduce resources.

Anti-aliased fonts. This'll need changes to NVDI/FVDI but that could be done soon.

OSX/Gdesklets style bouncing icon starterbar on the bottom of the screen. Perhaps a scriptable desktop widget system to complement that.

Samba network browsing and URI parsing. Highwire should be able to be loaded and html be viewed within the desktop browser windows.

A very elegant preferences system. Perhaps a redo of cpx's? Or maybe an embrace and extension of CPX's.

Tight freemint integration with package addition/removal built into preferences and perhaps a full application management/change tracking system. You could tell the desktop that you're about to install an application. It'll track the changes and provide a method for you to uninstall later.

Basically I want every element of the system to look and feel modern and beautiful when running in truecolor. Right now, when I use truecolor it's a very complicated affair to even tell! I have to run zweather, which has truecolor icons, or kronos whose opengl test is obvious when truecolor. To me this is understandable given how things were for so long, but at the same time I think we should work hard to make the supervidel (and aranym) more rewarding. If you ever look at screenshots of amigaos and morphos it'll probably make you sad because it's so beautiful. I want that for us too.

So that's that. I think our biggest weakness in the atari world is a lack of organization, drive, and a sense of urgency. To assure you all that I'm not a hypocrite, I recognize that I do this exact thing too.

We have a LOT of programmers around. I'd love for as many of them as possible to help. Therefore if the community likes the idea, and the manpower is available and the project happens, I'd like to manage the project and organize the milestone releases, etc. Additionally, I can host the cvs server, orient new developers who'd like to help but don't know where to start, documentation, quality control, etc. I'd also help with the coding to the maximum extent that I can.

People I'd love to have help:
ozk: bug hunting, general stability fixes and optimization. The work you've done to XaAES is no less than astounding. Perhaps assurance that someday it can be built on PPC?
Zorro: I like your style and I think zview/zweather is awesome, we'd need you to implement SVG support and recommend ways to implement zview codecs for such a heavy load. Would it cache every icon? etc.
Eric Reboux: Busy with myaes I'm sure, but the xgem look is fantastic and I'd like to implement the fonts, gradients, shadows, etc.

Basically anyone whose done any GEM work at all and understands C can get involved. A desktop is just a glorified GEM application after all! I've left many perhaps even better qualified people out of that list, but this is the kind of thing that will benefit from many hands and many minds.

A commercial quality desktop is really the final frontier for an OSS GEM environment!

PLEASE COMMENT ON THIS THREAD! Good or bad opinion, and everyone who CAN help please comment on how much you WILL help. I'd like to establish right from the start whether the project is worth it or possible rather than waste our time. I know there's enough demand for such a desktop, but the important question is how much time the gifted developers can spare

from their current projects and lives and if they want to.

Thanks,
Mark

Agreed. 425 watts is way high as far as what is necessary. However, I had it as a spare so I used what I had. If I had found the need to buy one, I surely wouldn't have bought one that large. Although I do have the CT60, RAM, CDRW, HD, floppy, etc, etc,...

Yes, it is the 2 IDE drive adapter. No need to wire anything - I simply hooked up a spare 80 gig Maxtor IDE HD that I had, via a standard IDE cable. Works straight out of the box. The adapter itself plugs straight into the original HD header on the Falcons MB. I'm not using the original 2.5" inch drive. (although I could have)

Or was that what you meant?

Mark,

I love the idea, and agree wholeheartedly! While I enjoy using my Falcon more than any other system, I do agree that there are a lot more desktop features that I'd like to see added, most of which you mentioned. And since Thing and Jinnee obviously aren't very active projects, and the whole concept behind Teradesk is a simple TOS-like desktop with multitasking-friendly features rather than a full-blown modern one like you (and I) want, your option is the only one left, as far as I can see.

I know from the posts so far that a lot of people here seem to be content with what's out there. This worries me a bit. Whenever most people are content with what's there, nothing new happens. When nothing new happens, things get more and more stale, old, and far behind other platforms. By the time we wake up and see the need to modernize, we're so far behind that it'll take an even more monumental undertaking than if we'd started now. This is just my opinion, of course, but if you think about it, isn't it true?

Unfortunately, I can't help much from a programming aspect (as I'm not a programmer), but I'll do what I can. Hopefully we'll actually get some people on board with this!

I've got a question for you Dr. Uwe.

Do you think a SCSI<->IDE converter
would have any broader application?

I mean, would anyone outside of the Atari
community be likely to have an interest?

I think the answer is probably 'No', especially
since the transfer rate is likely to be slow.

However, if there is likely to be a broader
interest in such a product it might offer
Alison more incentive to do it ;)

Actually, a more useful product might be
to do the conversion in the other direction,
and allow a SCSI drive to be read by a
standard IDE port. Every PC has IDE
ports, but not all have SCSI adaptors.

This is probably not a practical idea, though,
since the device would have to provide data
at a very high speed and it would probably
be easier just to buy a SCSI card for the PC.

Steve.

5662. Website update

Hi Mark,

In my opinion it's always a good thing to work
on improving anything, especially if it's an area of
special interest. That is, something you'll love doing.
You might come up with something original and
useful. I guess the sign of success is when Microsoft
'borrows' you ideas for Windows 2010 or whatever.

So.. go for it. Of course, if you need volunteers
to help I suppose you have to find some more true
believers ;)

I'm not volunteering, btw ;) I'm officially an ex
atarian now, since my ST/e has gone to a better home.

Steve.

512k, as you said, only 4 chips on the main board.
But on a daughter board, you can see DRAM chips. Ram accessed via HIMEM
I believe.

> I have used it on a 4meg 1040 STe TOS 1.62 and it works well.

I had problems with my Mega STE building the DMA chain correctly.
I have a DMA HD Syquest 44(lancom), the CDAR (dma too) and then a kind
of "link" interface with a 160Mb SCSI drive.

Plugging the Supercharger in first position, as said in the manual,
would not work at MS Boot-> crash.
I spent lot of time trying to debug the program, no result.
Then I had the idea of changing the order, and after lots of plugs, I
had it working this way:
Syquest -> CDAR -> Supercharger -> Link -> SCSI Drive.

> It would be possible to access the Net with the SuperCharger in DOS using
> Net Tamer. There is a version for pre-286 chips, as well as a 286, and a

Yes but what if you have the ADSL with USB or Ethernet and a poor Atari
with a serial output?

Guillaume.

Looking at this last board, you can see that it could be plugged into an
ISA slot, am I right?
Looks like Beta Systems started developing the 286 board, with tests
into a real PC, then plugged it into the Supercharger.

Guillaume.

I hate to announce something if I'm not sure but, after months(years?)
of negotiation and tons of mails, there is *maybe* a possibility that I
can buy the sources of Jinnee!

Off course, if I get the source code(I cross the fingers), the first
thing that I will do, is to put Jinnee under GPL.

> Now we have teradesk. An open source desktop. It's truly great in my

We have the same idea.

> but most importantly truecolor SVG...

Aarghh !! Do you know the CPU time needed to read (and to convert to a
raster) a vectorial SVG?

Absolutely no usable on our computer (even on a 68060).

> I would tend to want a stock icon set of the tango project as, quite

I totally agree with that.

> The icons should also be anti-aliased if it helps their appearance.

The anti-aliased icons need the transparency support in the VDI...
Actually only NVDI5 handles that.

> 3 styles of navigation.. OSX style with the multipaned window view,

My idea is to put (in option) a "navigation frame" like zview.

Nothing more, nothing less... I don't want to transform jinnee in a
monster that need tons of ram.

> OSX/Gdesklets style bouncing icon starterbar on the bottom of the screen.
> Perhaps a scriptable desktop widget system to complement that.

Well, if I get the source, I hope that others developers will help me :)

> Samba network browsing and URI parsing.

And FTP network browsing too.

Another feature that I want is the abstract access to various archives(
lzh, zip, tgz, ...).

I don't agree.

I want a Atari desktop usable on almost every 'modern' OS(I mean MiNT
and Magic).. I don't want a KDE/Gnome like with things such RPM
handling, etc...

Tiny, fast and powerful are the good words to describe that I would want.

> If you ever look at screenshots of amigaos and morphos

Very easy to do.

> Would it cache every icon? etc.

Off course, we can't to decode every icons in realtime :)

> Eric Reboux: Busy with myaes I'm sure, but the xgem look is fantastic and
> I'd like to implement the fonts, gradients, shadows, etc.

Eric gives sometimes a hand in MyAES but he doesn't code anymore for our
system :/

> I know there's enough demand for such a desktop

I'm sure that many Atarians wait a new modern desktop !

>, but
> the important question is how much time the gifted developers can spare

Zorro,

You must understand, I didn't even fathom the concept that we would be able to get the sourcecode to Jinnee! If that's possible absolutely positively I think we should use it! If we had the source to Jinnee (which I already consider quite close to perfection), the addons could be done just by you and me, there'd be no need to involve everyone because it wouldn't be so massive of a project. Out of curiosity, how much $$ are we talking about? hundreds of US$, thousands? Perhaps we could start a paypal donation center. I think a lot of people would donate a lot of money for a chance for open source jinnee.

Thanks,
Mark

Right !

We need also a good designer to draw some 'atari specific' icons :)

> Out of curiosity, how much $$ are we
> talking about? hundreds of US$, thousands?

500 Euros.

Now, I awaits a confirmation' mail from my "English to German"
translator(hi Sascha ;))

>reduce the work on the TOS !).

AFAIK, the MFP is EOL (at least at Motorola/Freescale, ST does not list it
also). That means that you will not get a lead-free version of the MFP, so
you can't build a new design containing the MFP that is ROHS compliant -
which is required if you want to sell the board to european customers after
Jul 1 2006.

I think emulating the required MFP functionality in some FPGA might be a
better solution.

I pulled the old (large) power switch out and used the front of Radio
Shack's smallest project box to mount a momentary micro switch in the
same switch opening. The box and the switch are black and look like
they were made for it! I also used the headphone jack on the front
to mount an on/off switch for the CT60.

Yes, and that's why converters like this already exist. There is no need to design a new one, one can simply buy an existing one. There are actually users who have such an adapter (ACARD AEC-7720U, for instance) and use it with HDDRIVER.

> I think the answer is probably 'No', especially
> since the transfer rate is likely to be slow.

The transfer rate does not have to be slow. There is no reason why you would lose any speed when using such a converter.

> Actually, a more useful product might be
> to do the conversion in the other direction,
> and allow a SCSI drive to be read by a

I doubt that a PC user would be intersted in this, because instead of buying an expensive SCSI drive and connect it to an IDE converter it makes much more sense to directly connect a stock IDE drive to a PC.

5673. CTLink project

Newsgroup: comp.sys.atari.st
Date: 2006-01-19 19:32:57 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <43cfe96f$0$12434$636a15ce@news.free.fr>
Source record: 9551

Hello,

The CTlink project was started a long time ago now...
After several months thinking I will finish the design (stills only the CPLD to code and the PCB routing around this CPLD), I realized three thru things :
1 - The power of MSTE, TT & standard F030 is too low to allow to really use Ethernet 100Mbits... Even 10Mbits and USB (12Mbits) will dramatically decrease the performance of these machines.
2 - Pre-orders are only 16 cards for MSTE, 25 for TT and 61 for F030. For the first 41, a second card is needed to adapt to VME. 41 is not enough to get a good price. And 61 on falcon is not terrible.
3 - I do not find motivation to finish this design (and win a bit money is not one).
4 - I need more time for some other projects I consider more important and really more motivating (CTPCI & new motherboard).

So, I decided to cancel the CTLink project.
The schematics and notes will be put into a ZIP file and everybody will be able to download.
There is no copyrights on this and if one of you want to finish I will be happy for atari communauty.

I strongly encourage Falcon user to buy CT63 + EtherNAT card that is actually produced by NATURE.
I have yet 7 CT63 in stock and may produce more if some falcon owners decide to go to 060.

Bye

PS : I will send back money nextly to people that already pay for CTLink, except if they inform me they want I keep money for an other project.

I've just obtained Papyrus from Ebay. A couple of questions:
- How can I backup the original disks?
- Does anybody has the RSC files translated to English?

Thanks in advance.

5685. ST parallel interface

Newsgroup: comp.sys.atari.st
Date: 2006-01-20 14:11:58 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <OMKdncrJ_fflck3eRVny3w@pipex.net>
Source record: 9562

Hey all,

Was thinking back to the good old days of controlling stuff from the parallel port. I know years ago I did a 12x6 led array which was controled from STOS, just using the LPRINT command to control address/data levels on the led matrix.

Was thinking of a small plug in box which would plug into the parallel port, will house some LED's for a indication that the port is active, then offering either a larger LED matrix box, or another box for controlling mains equipment etc, anything is possible really. The parallel interface will become the "host interface", which will decode commands and give probably a output set of 16 ports. Could even be used on the PC, even though most have gone USB now anyway.

Was half thinking aloud about this since its something ive had in mind for a while now, so just seeing if they would be any interest in doing a small production run of the things. The host itself isn't going to cost much to build and develop so its going to be pretty cheap *I think*. Depending on what people are wanting to control then it depends on cost of building some form of "output box", either holding power mosfets for controlling 12V motors/lamps etc, or relays for controlling mains equipment.

Was just a though about if there would be interest in it, controlling stuff from computers is always fun ;-)

Chris

5686. ATTENTION: Atari Clearance!

Newsgroup: comp.sys.atari.st

ATTENTION Atari customers. I'm buying out an Atari dealer, cleaning out
his ST software. Then Atari 8 Bit & Jaguar! I've paid for 80% of ST Games/
software & received 60% of ST Games/software so far! About 400 NEW Games!
If this works out I'll buy out his 8 Bit and Jaguar stock! I need to make
shelf room for NEW inventory and raise the capital to buy more Atari. If
you would like to help save Atari Goods from oblivion, step up and buy a
minimum of $100.00 of ANY Games/Software in my Classic Atari 8 Bit and/or
Atari ST Catalogs and get 20% off! E-Mail or call Ben at (503)256-9974!

http://BensCatalogs.Atari.org 5 updated Catalogs!
http://www.aracnet.com/~atari/newinbox.htm New Atari stuff!
http://www.aracnet.com/~atari/specials.htm Details on Sales!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Reminds me of the "Robotic" kit that sold for the ST for awhile, or the
X10 stuff that controls household appliances.

I'd be interested in a modern version that would run on all Atari models.

What about software? Thanks.

I can do software but it can only be in STOS, which unfortunatly will not run in any multi-os :-(I could publish the control docs for it should there be anyone who would want to write software for it... Will have to see if I can find someone before I consider the hardware as I think it could become problematic having being limited on one program running :-\

5697. 3D ARAnyM versatile package

Newsgroup: comp.sys.atari.st
Date: 2006-01-21 08:10:35 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <43d1ec7b$0$18341$8fcfb975@news.wanadoo.fr>
Source record: 9571

Hi,

It's a pleasure for me to announce the release of a 3D package
based on ARAnyM. This package includes many applications that
are related to 3D modelling and production of synthesis images.

More can be found on the following links :

[French]

<http://helijah.free.fr/Pack_3D/Pack_3D.html>

[English]

<http://babel.altavista.com/translate.dyn?lp=fr_en&doit=done&url=http://helijah.free.fr/Pack_3D/Pack_3D.html>

[German]

<http://babel.altavista.com/translate.dyn?lp=fr_de&doit=done&url=http://helijah.free.fr/Pack_3D/Pack_3D.html>

[Spanish]

<http://babel.altavista.com/translate.dyn?lp=fr_es&doit=done&url=http://helijah.free.fr/Pack_3D/Pack_3D.html>

[Italian]

<http://babel.altavista.com/translate.dyn?lp=fr_it&doit=done&url=http://helijah.free.fr/Pack_3D/Pack_3D.html>

This 3D package works similarly on 3 OS/platforms including
Windows, Linux and MacOSX.

Have fun :)

Please report your comments. You're welcome.

Best regards,

Sorry, not sure if that is a question for me.

The Brother is a HL 1440. My Atari is a 1989 520ST upgraded to 4MB RAM.
Marcel 2.3 WP with the HPLJET.PRD printer driver (one of the ones included
with the program which I bought from CyberSTrider many years ago).

>
> Mikael
>

Buy an LCD television with a VGA input on it (most have them). Then with a
little switch box you can toggle between low+med (scart) and high (vga).

But otherwise, high-res is all you will actually be getting on a PC monitor.
All you need is a cable which is wired up appropriately. The mono signal
from the ST goes straight to the VGA RGB lines.

Hi Taxman

I did think about that, but having just gone through the 6 pages of forms and used my Atari to transfer my digi-cam pics to floppy disk because this old Win95 PC can't read Compact Flash cards in its PCMCIA port - I couldn't be bothered to go back in to eBay to get it!

Look under Vintage Computing, type in "Atari Falcon CT60" and I bet you'll get to the requisite page! Not having seen another one advertised on it for months.

Neil :-)

Yes, this will get you the latest 1.16.1 beta release. If you havent
installed MiNT before, I would do the following;

1. Install EasyMiNT
2. Get the 1.16.1 beta at the above link, read the docs on how to
upgrade an EasyMiNT installation.
3. Get the latest alpha release from xaaes.atari.org, it contains the
current 1.16 kernel, 1.16.cur.

Best Regards,
Odd Skancke

Yeah,

This is a better solution for the newbie. But in a little bit the
atari-source.org problems should be fixed. Someone needs to tell me this
stuff ;)

Thanks,
Mark

I installed this on windows XP. It looks beautiful thanks for all
your work. My question is this - when I tried to run some of my other
programs by
copying them to the "programm" folder they just wouldn't work. Am I missing
something or is it necessary to have Aranym specially configured for office
& DTP programs?
Papyrus versions 4, 5 & 7 wouldn't run. Calamus SL96 tried to load but was
unuseable, DAs Layout also no go. Atari Works loads, starts a new document
but the menu options are then grayed out making them inaccessible.
Harlekin III loads and appears to work.
Any suggestions would be appreciated. I do have NVDI 5 (a legitimate
copy) so
I could use that if it helps things along. Also would using Tos 4.04
improve
compatibility with earlier programs?
Does anyone else have experience with this?

regards
Maurice

Hi,

Before I change my current configuration (NVDI, NAES, NTHING, MINT) my plan was to play with Aranym first. But I absolutely confused. I tried FVDI, XAAES, TERADESK, MINT. How the screen resolution and color depth is determined? There are configuration items in FVDI.sys, XAAES.cfg and also options in TERADESK. What should I set in these files to get 1024x768x65535?

Thanks,
Jozsi

In fvdi.sys set resolution to 1024x768@16 (there's examples in there). In XaAES, I think you can just leave it alone, but if it's being strange, just set it to video=27. As for teradesk's config, I didn't even know it had a resolution setting but it shouldn't change your situation. Check out the afros disk for more info on getting things setup properly.

Thanks,
Mark

You may ask questions on the ARAnyM's mailing list to share your
experience with other users at : <http://aranym.atari.org/>.

> I do have NVDI 5 (a legitimate
> copy) so
> I could use that if it helps things along.

NVDI is a commercial product that can't be placed in a free package.

> Also would using Tos 4.04
> improve
> compatibility with earlier programs?

Yes, it may ... You're right. Please test and report about it.

> Does anyone else have experience with this?

You will meet other users on the ARAnyM's users list :)

Anyway, you know that if ARAnyM hasn't reached the "1.0" version
number, that means that it is still under strong testing stage.

Please let us know about your testings.

Hi Francois!

> Please report your comments. You're welcome.

I tried it for about 5 seconds (yes!!!) and I got a fatal crash in aranym.

What I did is this:
Scroll up and down on the teradesk window using window widgets. Could reproduce it 3 times in a row. Now that I opened my emailer, it wont happen anymore, instead I get bus errors, crashing the desktop, etc.

So whose fault is this now? Aranym? MyAES? Aranym MiNT Kernel? fvdi? libSDL? Windows XP?

Only God knows! Sorry, I dont even manage to test this. This is what I have been criticizing about aranym forever and this is exactly what prevents me from reporting bugs.

If I send in such a bug report as this one, it is too easy to say: Not our fault.

Really, it was my fastest crash ever!

And most annyoing: aranym hooks the mouse then. Hard to get it back (but possible).

Maybe I manage to run it for longer than five minutes. If I do, I will let you know about the programs and how I like those.

Cheers, Ingo =;=>

Hallo Edward S. Baiz,

>I have and use version X.

A little question: I found a problem in Papyrus X when using the options for the dialoges. Papyrus crashes and freezes my PowerBook (MacOS 8.6 with MagiCMac 6.2) when saving the changed options for the "dialog". With MacOS X and MagiCMacX Papyrus doesn`t crash, but the options "dialog" can not be calles from the menu directly. What happens, if you change the behavior of the dialogs for the buttons "OK", "Cancel" vs. "Accept", "Back" and save these changes?

Well ... I'm not responsible for the Windows version. I personally
built the Linux and MacOSX versions for the Pack_3D configuration.

I know that there's problems with the Windows version. I think that
it is related to the usage of a too old SDL library when building
the Windows ARAnyM version (SDL.DLL).

In any case there doesn't seem to have such problems with Linux or OSX.

What you can do is to report problems on <http://aranym.atari.org/> in
the users mailing list.

You know that ARAnyM hasn't reached the "1.0" number version, and that
we really need to hear feedback from users.

Thanks for giving a try to the Pack_3D configuration :)

We look forward to hear from you.

I know that the Pack_3D is mainly localized in French. It has a kind
of "French touch" :) But you know that most softwares that are included
in the package have the corresponding configuration for other languages.

In any case, if you don't find your mother tongue language, that is
almost available for all softwares, the RSC editor "Interface" is
present in the package, so that you can translate programs for your
personal usage. You may also contribute for the translation of
softwares, so that other ATARI users can benefit from you work :)

Did you hear of <http://atari.transaction.free.fr/> WEB site ?

> And starting CAB also freezes things here. zview, eb_model and qed work
> fine, though.

CAB freezes ARAnyM only for the Windows supported platform. It is
not the case for the Linux and OSX versions that I personally
maintain. The precise problem should be related in the ARAnyM's
users list, so that you have answers from Windows maintainers.

Thanks for giving a try the Pack_3D configuration.

We hope to hear from you :)

No, other software work like this, but some software could possible not
like Hostfs. To see if it is you can try to copy it on C drive to see,
if it come with this or not.
> Papyrus versions 4, 5 & 7 wouldn't run.
I don't know if it work, I have test version 2, 8 and 10
2 work, and 8 and 10 can be run but not work correctly because we can't
edit anything, this a myaes trouble (or a possible bug in Papyrus, if it
can't find NAES or Magic (I have to try to put a cookie to see if it is
this soon!))

>Calamus SL96 tried to load but was
> unuseable, DAs Layout also no go.
Francois which version do you use?
>Atari Works loads, starts a new document
> but the menu options are then grayed out making them inaccessible.
Perhaps an myaes trouble, I have not this software to test.
> Harlekin III loads and appears to work.

Yes of course a lot of software access directly to video, and not like
fvdi for this, but for speed the only way is fVDI, that is it not bad at
all, and work well with a lot of applications.

>
> regards

> Maurice
>
If you wan't to answer me directly by mail, don't foget to remove BIDON.
from my email address, I need feedback for software test, for MyAeS that
I developp.

For Inshape III, unfortunatly there is only french version, someone should do translation (ressource and 100 pages of doc!), but never do it because he is dead some weeks after have the Inshape package. There no ask for this, and work is to big, to do only for fun unfortunatly. So no version of Inshape except in french.

The problem with TrueType fonts is related to the fact that ARAnyM
really needs the latest SDL library for freeType2 support. Do you know
that the SDL.DLL library that is present in the Pack_3D configuration is
about 10 times bigger than the current SDL.DLL 1.2.9 Win32 version ?
This is due in my understanding, to the fact that the latest versions
take much better advantage of Windows APIs.

There's no real need to add nfVDI building switch for freeType2 support.
It should work really great if you just update SDL, and build ARAnyM
again from it.

The current CVS version of ARAnyM really need an uptodate SDL version.

Best regards,

I have test with new version, this is alway's the same, cab still freeze.

Well, then bad luck :(It is not the place to report such a bug.

Anyway, when you update SDL with CygWin, do you choose a stable version
or the current version ? Current should be preferred to stable version.

I hope it can help.

A cvs version, as you do for MacOS or Linux, it should be CVS version
from 10 january 2006. Without this aranym.sys couldn't run with old
official 0.9 version.

I have actually no time to spend for this, I have already relate this to
Johan. I'm not sure to have do good options (I just add JIT option to
```

default), if I try add opengl option Aranym crash at start.

I can't do more, for a year I'm not in the developper mailling list of Aranym, because I have no time to spend for it, because all my time is for MyAeS, and it's enough for me!

So for the moment Windows user should know, there probably bug comming with specific windows version, cab couldn't work (except remove truetype font folder) or use highwire!

Olivier

Hi!

While it is interesting circumstance it is just by pure chance. As an original author of the FreeType2 support in fVDI I can safely tell you that it cannot relate to SDL library version ARAnyM is compiled against. It does not attempt to use any NF (host OS) stuff in there. It should work the same way on any m68k box out there.

That said I should also warn you that the vector font support in fVDI is not mature enough and a lot of apps have problems with that. fVDI is open-source and so you can contribute to bug fixing and improving its compatibility.

PLEASE PEOPLE! REPORT BUGS IN OUT ARANYM MAILING LISTS! Read http://aranym.sf.net for more information.

Regards

STanda

It doesn't seem that you know how to upgrade CygWin. And that's what I
don't understand about what you're doing under Windows. It is not the
same thing at all, than under Linux or MacOSX, indeed.

What you have to do is to call "Setup.exe" that is available on :

<http://www.cygwin.com/>

and to ask to the FTP installation GUI to upgrade the development (and SDL) packages.

> Without this aranym.sys couldn't run with old official 0.9 version.
>
> I have actually no time to spend for this,

We just ask you to build a Windows executable ... No more than that ;)

> I have already relate this to
> Johan.

You know that it is not a bug of fVDI indeed. Otherwise it wouldn't work under Linux and OSX. No ... The problem is related to your devel environment.

> I'm not sure to have do good options (I just add JIT option to
> default),

That's fine like that. Just add JIT options, and that's fine. My building options under Linux look like :

```
./autogen.sh --enable-jit-compiler --enable-jit-fpu CFLAGS="-march=i686
-funroll-loops -fexpensive-optimizations" CXXFLAGS="-march=i686
-funroll-loops -fexpensive-optimizations"
```

You can do a similar build under CygWin. GCC should be 4.x, is it ?

> if I try add opengl option Aranym crash at start.

We ask you to build a standard package. Nothing more. No OpenGL.

> I can't do more, for a year I'm not in the developper mailling list of
> Aranym, because I have no time to spend for it, because all my time is
> for MyAeS, and it's enough for me!

If you're working on MyAeS, and use ARAnyM for it, it would be better that you have a working version of ARAnyM. The current version of ARAnyM is quite stable, as you could test under Linux. It would be a good thing for you, first to have a correct GygWin devel environment, to (second) build a working version of ARAnyM. You will then be able to debug MyAeS under Windows.

And we all need a working version of ARAnyM under Windows, to insert it in the Pack_3D configuration.

Please we need it ! And it is affordable for your devel skills :)

> So for the moment Windows user should know, there probably bug comming
> with specific windows version, cab couldn't work (except remove truetype
> font folder) or use highwire!

Did you read all bug reports from Ingo Schmidt ? The Windows version
that you built is almost not usable. You should care about it ;)

No, I'm not stupid, I use cygwin for long time ago, my update should
date of 2 weeks only! This is enough! It's strange like people think
when there is an update, older version can't be good for what they work
before.

So please not said me how use cygwin, I use it for first port of Aranym
on windows, authors at this time not think a version like this could
appear so fast, they not plane do it before 1 year, if I remember!

For a long time cygwin was very difficult to update for me (stop near 20
times before finish and take near 1 day for this!), now I have install
it in half an hour!

So if you are so good try to do better I have no time for this.

But it can be an fvdi bug, or aranym bug or anything else, really I
don't know how you can said this, bug are sometime so strange!

All here is developpement (emutos, aranym, fvdi, myaes) except perhaps
Mint that looks very stable.

Notice code optimisation, should not change anything in bug, and is
expected to add new bugs, I prefer default option comming with configure
notice too that --enable-jit-fpu is done by default.
>
> You can do a similar build under CygWin. GCC should be 4.x, is it ?

The default one on cygwin: 3.4.4

It work not so bad except this, because I can even launch Papyrus 10 and load vectorial fonts without trouble, but Papyrus unfortunatly not work correctly (can't edit), but this is a known trouble comming with myaes! (nothing is perfect!)

Now it's not to me to said if Windows version is conform or not to what it should, this should be do, with the official realease and not a develop version, as we use it, I suppose when Aranym team will look to do this official release, they will try to compil in most target possible to test, as they alway's do (For Windows Petr do it generally), and alway's there is specific fix, and correction bugs. If they not do it, it's because they thing it's not time for this (not finish), and because it's an hard and long work, impossible to do all month. We only use an CVS version, because there was done a very interesting work on it.

Olivier

So then, you do your best. I think that the main reason why ARAnyM
doesn't work under Windows is that CygWin is now obsolete. I recently
heard that there's a new commercial devel environment that take place
of CygWin that is much more efficient. CygWin seems to be abandoned
and not suitable for our kind of developments :(

I already maintained Linux and MacOSX versions for this work. Sorry
but I can't do anything more. I have no special affinities with
Windows either :P

What a nonsense ! Sorry but optimizations are taking a great importance.

>> You can do a similar build under CygWin. GCC should be 4.x, is it ?
>
> The default one on cygwin: 3.4.4

That's why I tell you that CygWin is now obsolete.

>>> if I try add opengl option Aranym crash at start.
>>

Windows is useless. There's no reward to develop in such an OS.
This is so messy ! Forget it !

>> And we all need a working version of ARAnyM under Windows, to insert
>> it in the Pack_3D configuration.
>>
>> Please we need it ! And it is affordable for your devel skills :)
>>

I'm aware of the Papyrus problem. It's not an important thing.
It will be fixed. I'm confident :)

> Now it's not to me to said if Windows version is conform or not to what

So. Please ATARI peoples, stop using Windows, and don't complain
anymore about it. We do our best, but it is so messy that no warranties
of any kind can be given on the correct usage of the Windows port !

Linux is free and available from everywhere. It's friendly :)

Stop playing with fire, and migrate to Linux. It's such a reliable
operating system !

And remember that we're all gods ;)

Why? Very thin laptop with lots of backorders that will take Q3 to
catch up.

Now that iTunes has rolled over Napster, who's next?

I give Steve a year to be CEO of Disney.

Actually, the emulator was originally written by Charles MacDonald, but
I've ported and adapted it for the Atari.

I've discovered a nasty bug in the sound emulation part, which
sometimes turns off the internal IDE drive, and can probably cause all
sorts of bad things. A new version will be out soon. Sorry for this.

No why? I still use Mandriva 2005, and Aranym work fine for me, and if
I'm true by default it's gcc 3.xxx on it.

When I see all updates of cygwin, I think it's not stop dev!

That's why I asked you if you were using "stable" or "current" versions.

> No why? I still use Mandriva 2005, and Aranym work fine for me, and if
> I'm true by default it's gcc 3.xxx on it.

Yes, on my dual-G4, because I'm working with OSX.3.9, it is GCC 3.3.x.
And it is not an uptodate system ... I don't want to migrate to Intel :P

But on my P4, I installed Mandriva 2006 (Cooker), and it is uptodate
with GCC 4.0.2 :) We're really taking benefit from GCC 4.x on x86
archies.

Hey gang. I've got a Freekeys replacement keyboard setup that I bought used. 2 of the wires on the cable connection to the case plug have come loose and need to be resoldered.

Can anyone tell me how the wiring goes on this? (which color wire to which pin? There are only 5 of them I believe. The wires are red, bluce, white, and black. It appears there are 2 blacks.

Thanks.

> these changes?

PowerMac G5 and MagiCMacX 1.2 here, and you're quite right about the "Dialog" dialog box - one has to choose another option from the cascading menu, and then get to the "Dialog" popup from there. Funnily enough, I had this working perfectly the first time I tried!

The actual choices don't seem to "stick" either, from what I can see.

Overall, I'm not too impressed by the presentation of this program (English version). There's still some untranslated German and as for some of the dialog box and button texts...

I've thought about this and for me it highly depends on cost. Can you produce the board for $25 or $100? Because it makes a difference on justification. I already have to spend 10bazillion $ on CTPCI, SuperVidel, etc because... well.. I love my falcon, but SCSI drives are dime a dozen these days and I have plenty of scsi goodness on my tt and mega ste's. And this project isn't even for TT or mega ste. Naturally there's the problem where we're probably going to run out of scsi drives that work on these old interfaces but I think we're a ways away from that. To top it all off, should I really be buying hardware for computers I haven't used enough? (My TT's and Mega STe). I wish electricity was free.

Thanks,
Mark

Although I think it´s possible to develop.... some days ago I found
some demo on the net (shit, I dont remember it´s name nor the crowd!)
that was distributed in MSA format, and for real Ataris, a .TOS file
was included as a loader....

Hey coders!! Give us your experienced opinion!!!

Regarding Papyrus:

I have all original Papyrus Gold v.5 which is the color version IIRC.

I've not really used it yet, and was wondering if it is worth upgrading to
the X version or
a version below X?

What are some of the biggest improvements over say version 5?

> Does anybody know if there=B4s a way to boot a MSA file stored on the ST
> HDD directly without writting it onto a floppy?=20

I am acutally write a (simple) program which allows to read or write such disk images on a Atari. I want also add a MetaDOS driver which should allow to mount such images and access them like any other drives.

I dont want add booting from images because I think, it is not easy. While booting from such an image i need to have access to the HDD. But to have access to the HDD i need the harddisk driver to be present wich is normaly the case if i have booted from HDD.

Best regards
Michael

Yeah, should be quite simple to do. And don't forget a program/accessory
to change the "mounted" floppy image.

Most autoboot floppies are games and demos, which are likely to take over
the system, hence crashing/preventing any further access to any hard disk
you could have. So you should be able to run the program in boot sector,
but not much more.

With a 68030 or higher processor with a PMMU, it might be possible to
create a virtual ST address space, so any hardware access could be
redirected softly, but it is something that needs much more work. Well, it
would be an ST emulator, using main CPU to run the program instead of an
emulated 68000.

What about redirecting the floppy to a ramdisk? I.e. load the file from
the hard drive, into memory then warm boot the ST? Obviously won't work
without a fair bit of ram, and multi disk games would be a problem to.
Especially considering most of the PP stuff etc, is packed all ready.

Perhaps even better approach would be to write a BetaDOS's cluster.dos
replacement where certain file types would behave as folders simply
(.msa, .zip, ...). It should be quite easy to write using avf.sf.net
virtual filesystem implementation and aranym.sf.net hostfs filesystem
implementation (when you port its core to m68k - should not be
difficult). But it would be quite slow I can imagine.

This is not even easily possible under MiNT .xfs as the filesystems
there are not stackable (in the sense that you could access a file that
is on the ext2 inside a .zip packed .msa). At least if I am not
mistaken.

Hi!

I just wanted to let you all know that I still have 2 more cards (and perhaps even some more from this March - depending on the demand) of a 16MB Falcon ST-RAM extension cards.

I am only a distributor, Petr Svoboda's site (the author) is: http://www.volny.cz/boban07/RAM_kartice/

The US price is $52 USD (includes the card, 16MB SIMM), shipping is free.

Let me know if you are interested.

Best Regards

STanda

To everyone,
I have used this same card in a stock Falcon that Mark D boosted up in several areas. CPU 20Mhz., DSP 50Mhz., BUS 20Mhz., Videl 40Mhz., 68882 FPU boosted to 64Mhz. Mark D can vouch for this, the card that the computer was sent to him with had major artifacts and would not boot properly. After changing out the STRam card with this one it worked GREAT!!!!! I also tested this on my CT60 boosted to 25 mhz.!!!! Works Great there. Buy with confidence that it will work great for you.

Thanks,

--

Even for a ramdisk, you'll need a ramdisk driver, that must be kept
functionning while the game/demo is running. And there is a big
probability it will get overwritten the same way as an hard disk driver.

Only cleanly written software will work with such a setup, or games/demos
that have been patched to use OS functions for disk and memory access.

Yep, only the root 'U:\' drive allows mount points under MiNT. And this is why filesystems are not mountable/mounted anywhere else.

And there is also the fact that a file opened by a device driver has its handle assigned to the process that opened that device, not the kernel. I tried a while ago to write a loop device for MiNT, and was stuck there: a 'mount' program tells a /dev/loop device to open a file, but when the 'mount' program ends, the opened file is closed, and thus can not be used to mount a filesystem on it.

Hi,

> Yeah, should be quite simple to do.

Yes, i dont expect much problems. I need only a BOS driver with read functions. And then i have the full functionality of the desktop for access to the image. This is the reason why my simple program for access directly the image is quite simple.

> And don't forget a program/accessory to change the "mounted" floppy image.

I dont forget it, it was stil on to ToDO list.

I have a nice book about drives on Atari ST (Scheibenkleister). This book
contains a part about a ram disk which was alive after reset and dont need
to boot a driver after reset. And it is possible to boot from this ramdisk. It
was the "Luftschloss" from Claus Brod and Anton Stepper.

Maybe it is possible to use this ideas to load the disk image and use it
after reset to boot from.

Best regards
Michael

One random caller each month will win a free subscription to ST Magazine.

You were apparently more "random" than the others this month. :-)

5789. Reanimator 2 intro and overview

Newsgroup: comp.sys.atari.st
Date: 2006-02-02 03:20:08 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.02.02.03.20.08.674352@charter.net>

Here is a short intro and overview to Reanimator II, this months prize game on The DarkForce! BBS. You'll have to play often to win! :-)

R e a n i m a t o r

... how did you get here? You can't remember for sure. All you can remember are the sounds... the music of the spheres. You sense that you were cast into this darkness by powerful hands... hands that control your destiny... of someone with a power that you cannot imagine.

You feel a strange surge within you, and you know you have changed somehow... and you suddenly notice the book in your hands. You open it to find spells of which you know nothing... conjurations of the spirits... and the power to reanimate!

Then your become aware of one more thing -- you are not alone... and from the constant probings within your mind, you doubt that they are friendly.

One voice comes thru louder than the rest... it is the voice that belongs to the powerful hands... "Destroy all others!"
"By Enlil, I command thee!!"

In Reanimator,you become a Necromancer at war with other Necromancers. You must maintain a mighty army of undead soldiers in order to prevent other Necromancers from dueling (using powerful spells) against you.

At the same time, you must increase your magical energy, strength, and endurance in order to perform your varied options -- among them is the opportunity to attack other Necromancers. Other choices include the reanimation of the dead to create reinforcements, sending out zombies on search missions (who knows what they will come back with), drinking magical potions, and praying to your gods.

You will need your staff to cast those spells, so hang on tight! Other magical items in your possession are the powerstone (used for storing energy that cannot be lost as long as you are alive), and a crystal ball (used to spy on other Necromancers).

The top _surviving_ reanimator will each month be added to the Hall of Fame. Will your name be written there, N e c r o m a n c e r ?

Good luck all! :-)

5795. Cheap TT for sale

Newsgroup: comp.sys.atari.st
Date: 2006-02-02 20:10:00 UTC
From: Peter_Schneider@b.maus.de
Message-ID: <200602022110.a24814@b.maus.de>
Source record: 9431

Hi,

a friend of mine likes to sell his TT. I think the machine has got 4/4
megs of ST/TT RAM.

It works inside a Tetra tower, there are two hard drives with about
345 megs of space. A Syquest 44 (or 88 meg) drive and a graphics card
by Matrix (256 colours) also belong to the system.

I think there's a CD rom but my friend doesn't think so. We should
have another look to the machine together... Some soft (e.g. CUISINE,
ADIMENS, SIGNUM!4) will be supplied as well. The keyboard is German.

He proposes a price between 100 and 200 Euros and will give a 15 inch
monitor, too.

Handicap: The buyer will have to take it over at Bonn, a small city 20
miles south of Cologne, Western Germany (geographically speaking).
Contacts welcome in French or German (both preferred, for he's
a French living in Germany) or any Latin language.

Anyone interested may contact me and I'll forward the mails to him.

Und TTschï¿½
ps

For what I remember there was a converter able to read ST Basic listings and output .lst files.
Was not entirely compatible, but at least it took care of line numbers and stuff.

With the exception of maybe the 8-bitters, any Atari computer can
display 80 column text. Although, since you need a web browser to get
to your site, anyway, why not just do it in HTML? That way it'll format
itself to fit whatever size the web browser's window is.

If I'm going to do this, I need to follow follow the K.I.S.S. method or K.eep I.t S.imple S.tupid! My Web Site is already in HTML. My On-Line Catalogs already use HTML. As far as my Catalogs go, I maintain them in straight ASCII text in a simple Text Editor. ST Writer Elite v.4.8! Available for download, in the Lowest Common Denominator. Thanx! ===Ben===

For Immediate Release:
2/7/2006

Atari Video Club needs your help making a new slogan for
this years show. So we decided to make a contest out of it.
The winning slogan will be fetaured on selcted items in
our store cafepress.com The person with the winning slogan will
also win a white t-shirt that has the slogan on the back of
the shirt and our new Logo on the front.
here are the rules:
1) slogans are to be orignal and not a parody of of known
slogans.
2)slogans must either include the words "Video Games","Computers"
and "Family fun" or at least reference to the words.
3) theres a limit of three slogans per person
4) Contest is open to everyone!!
5) deadline for enteries in June 2nd,the winning slogan will
be announced on June 13th.
E-mail your contest submitions to the e-mail address listed below
with the subject: Slogan contest.
The 2006 Video Game Summit is on August 12th, 2006 from 9am to 6pm at
the Fairfield inn and Suites (Heron point building), 645 West North
Ave,
Lombard, IL 60148.
Visit the VGS website: http://avc.atari-users.net/VGS.html
For more information about Video Game Summit
contact Daniel Iacovelli at AtariVideoClub@yahoo.com

I was going to suggest something edgey like "ATARI Sux" which would
appeal to the younger generation, although when I read it had to
include "Family fun" I realised it would not be appropriate.

Perhaps "Family fun Video Games and Computers Super Happy Atari Video
Club!", with some kinda hyperactive asian guy promoting it at the
Summit..

the slogan is for the show not the club it self.
thats why the title of the post is Video game summit slogan contest.
all submittions has to be e-mailed btw.

ATARI - We Once Were Synonymous With Video Games Until We Let Nintendo
Steal It From Us.

ATARI - Because Infogrames Was a Stupid Ass Name.

Oops. Not sure that 2nd one will qualify. It's a good one though.
